Handbook of Biomedical Image Analysis David Wilson, Swamy Laxminarayan, 2007-04-25 Our goal is to develop automated methods for the segmentation of the dimensional biomedical images Here we describe the segmentation of focal microscopy images of bee brains 20 individuals by registration to one or several atlas images Registration is performed by a highly parallel implementation of an entropy based nonrigid registration algorithm using B-spline transformations We present and evaluate different methods to solve the correspondence problem in atlas based

registration An image can be segmented by registering it to an individual atlas an average atlas or multiple atlases When registering to multiple atlases combining the individual segmentations into a nalsegmentationcanbeachievedbyatlasselection ormulticlassi erdecision fusion Wedescribeallthesemethodsandevaluatethesegmentationaccuracies that they achieve by performing experiments with electronic phantoms as well as by comparing their outputs to a manual gold standard The present work is focused on the mathematical and computational tory behind a technique for deformable image registration termed Hyperelastic Warping and demonstration of the technique via applications in image regist tion and strain measurement The approach combines well established prin ples of nonlinear continuum mechanics with forces derived directly from thr dimensional image data to achieve registration The general approach does not require the de nition of landmarks ducials or surfaces although it can commodate these if available Representative problems demonstrate the robust and exible nature of the approach Three dimensional registration methods are introduced for registering MRI volumes of the pelvis and prostate The chapter rst reviews the applications xi xii Preface challenges and previous methods of image registration in the prostate
