Heart Rate Variability: Clinical

Applications and Interaction between HRV and Heart Rate Karin Trimmel, Jerzy Sacha, Heikki Veli Huikuri, 2015-10-07

Over the last decades assessment of heart rate variability (HRV) has increased in various fields of research. HRV describes changes in heartbeat intervals which are caused by autonomic neural regulation, i.e. by the interplay of the sympathetic and the parasympathetic nervous systems. The most frequent application of HRV is connected to cardiological issues, most importantly to the monitoring of post-myocardial infarction patients and the prediction of sudden cardiac death. Analysis of HRV is also frequently applied in relation to diabetes, renal failure, neurological and psychiatric conditions, sleep disorders, psychological phenomena such as stress, as well as drug and addiction research including alcohol and smoking. The widespread application of HRV measurements is based on the fact that they are noninvasive, easy to perform and in general reproducible if carried out under standardized conditions. However, the amount of parameters to be analysed is still rising. Well-established time domain and frequency domain parameters are discussed controversially when it comes to their physiological interpretation and their psychometric properties like reliability and validity and the sensitivity to cardiovascular properties of the variety of parameters seems to be a topic for further research. Recently introduced parameters like pNNxx and new dynamic methods such as approximate entropy and detrended fluctuation analysis offer new potentials and warrant standardization. However, HRV is significantly associated with average heart rate (HR) and one can conclude that HRV actually provides information on two quantities, i.e. on HR and its variability. It is hard to determine which of these two plays a principal role in the clinical value of HRV. The association between HRV and HR is not only a physiological phenomenon but also a mathematical one which is due to non-linear mathematical relationship between RR interval and HR. If one normalizes HRV to its average RR interval, one may get pure variability free from the mathematical bias. Recently a new modification method of the association between HRV and HR has been developed which enables us to completely remove the HRV dependence on HR, even the physiological one, or conversely enhance this dependence. Such an approach allows us to explore the HR contribution to the clinical significance of HRV, i.e. whether HR or its variability plays a main role in the HRV clinical value. This Research Topic covers recent advances in the application of HRV, methodological issues, basic underlying

mechanisms as well as all aspects of the interaction between HRV and HR

Heart Rate Variability Analysis with the R package RHRV Constantino Antonio García Martínez, Abraham Otero Quintana, Xosé A. Vila, María José Lado Touriño, Leandro Rodríguez-Liñares, Jesús María Rodríguez Presedo, Arturo José Méndez Penín, 2024-10-04 This book introduces readers to the fundamental concepts of Heart Rate Variability HRV and its most important analysis algorithms using a hands on approach based on the open source RHRV software HRV refers to the variation over time of the intervals between consecutive heartbeats Despite its apparent simplicity HRV is one of the most important markers of autonomic nervous system activity and it has been recognized as a useful predictor of several pathologies The book discusses all the basic HRV topics including the physiological contributions to HRV clinical applications HRV data acquisition HRV data manipulation and HRV analysis using time domain frequency domain time frequency nonlinear and fractal techniques Detailed examples based on real data sets are provided throughout the book to illustrate the algorithms and discuss the physiological implications of the results Offering a comprehensive guide to analyzing beat information with RHRV the book is intended for masters and Ph D students in various disciplines such as biomedical engineering human and veterinary medicine biology and pharmacy as well as researchers conducting heart rate variability analyses on both human and animal data The second edition of the book has been updated to RHRV version 5.0 This version introduces a functionality to perform heart rate variability analysis on entire populations This functionality automates and streamlines both the calculation of HRV indices in the time frequency and nonlinear domains as well as the subsequent statistical analysis

Heart Rate Variability Extraction from Video Signals Karim Alghoul, 2015

Heart Rate Variability HRV analysis has been garnering attention from researchers due to its wide range of applications Medical researchers have always been interested in Heart Rate HR and HRV analysis but nowadays investigators from variety of other fields are also probing the subject For instance variation in HR and HRV is connected to emotional arousal Therefore knowledge from the fields of affective computing and psychology can be employed to devise machines that understand the emotional states of humans Recent advancements in non contact HR and HRV measurement techniques will likely further boost interest in emotional estimation through Such measurement methods involve the extraction of the photoplethysmography PPG signal from the human s face through a camera The latest approaches apply Independent Component Analysis ICA on the color channels of video recordings to extract a PPG signal Other investigated methods rely on Eulerian Video Magnification EVM to detect subtle changes in skin color associated with PPG The effectiveness of the EVM in HR estimation has well been established However to the best of our knowledge EVM has not been successfully employed to extract HRV feature from a video of a human face In contrast ICA based methods have been successfully used for HRV analysis As we demonstrate in this thesis these two approaches for HRV feature extraction are highly sensitive to noise Hence when we evaluated them in indoor settings we obtained mean absolute error in the range of 0.012 and 28.4 Therefore in this thesis we present two approaches to minimize the error rate when estimating physiological measurements from recorded facial videos using a standard camera In our first approach which is based on the EVM method we succeeded in extracting HRV measurements but we could not get rid of high frequency noise which resulted in a high error percentage for the result of the High frequency HF component Our second proposed approach solved this issue by applying ICA on the red green and blue RGB colors channels and we were able to achieve lower error rates and less noisy signal as compared to previous related works This was done by using a Buterworth filter with the subject s specific HR range as its Cut Off The methods were tested with

12 subjects from the DISCOVER lab at the University of Ottawa using artificial lights as the only source of illumination This made it a challenge for us because artificial light produces HF signals which can interfere with the PPG signal The final results show that our proposed ICA based method has a mean absolute error MAE of 0 006 0 005 0 34 0 57 and 0 419 for the mean HR mean RR LF HF and LF HF respectively This approach also shows that these physiological parameters are highly correlated with the results taken from the electrocardiography ECG *The Study of Heart-rate Variability* R.
