Handbook of Biomedical Nonlinear Optical Microscopy Barry R. Masters, Peter So, 2008-05-19. The Handbook of Biomedical Nonlinear Optical Microscopy provides comprehensive treatment of the theories, techniques and biomedical applications of nonlinear optics and microscopy for cell biologists, life scientists, biomedical engineers and clinicians. The chapters are separated into basic and advanced sections and provide both textual and graphical illustrations of all key concepts. The more basic sections are aimed at life scientists without advanced training in physics and mathematics and tutorials are provided for the more challenging sections. The first part of the Handbook introduces the historical context of nonlinear microscopy. The second part presents the nonlinear optical theory of two and multiphoton excited fluorescence, TPE, MPE, spectroscopy, second and third harmonic generation, SHG, THG, spectroscopy and coherent anti-Stokes Raman spectroscopy, CARS. The third part introduces modern microscopic and spectroscopic instrumentation and techniques that are based on nonlinear optics. The fourth part provides key applications of nonlinear microscopy to the biomedical area: neurobiology, immunology, tumor biology, developmental biology, dermatology and cellular metabolism. There are also chapters on nonlinear molecular probes, cellular damage and nanoprocessing.

Laser-Induced Breakdown Spectroscopy Jagdish P. Singh, Surya N. Thakur, 2007-10-03 Laser induced breakdown spectroscopy LIBS is basically an emission spectroscopy technique where atoms and ions are primarily formed in their excited states as a result of interaction between a tightly focused laser beam and the material sample The interaction between matter and high density photons generates a plasma plume which evolves

with time and may eventually acquire thermodynamic equilibrium One of the important features of this technique is that it does not require any sample preparation unlike conventional spectroscopic analytical techniques Samples in the form of solids liquids gels gases plasmas and biological materials like teeth leaf or blood can be studied with almost equal ease LIBS has rapidly developed into a major analytical technology with the capability of detecting all chemical elements in a sample of real time response and of close contact or stand off analysis of targets The present book has been written by active specialists in this field it includes the basic principles the latest developments in instrumentation and the applications of LIBS It will be useful to analytical chemists and spectroscopists as an important source of information and also to graduate students and researchers engaged in the fields of combustion environmental science and planetary and space exploration Recent research work Possible future applications LIBS Principles *Biomaterials Fabrication and Processing Handbook* Paul K.
