Decontamination of Heavy Metals Jiaping Paul Chen, 2012-12-18 Heavy metals such as lead chromium cadmium zinc copper and nickel are important constituents of most living organisms as well as many nonliving substances Some heavy metals are essential for growth of biological and microbiological lives yet their presence in excessive quantities is harmful to humans and interferes with many environmental processes Heavy metals are also nonbiodegradable making them more difficult to remediate Decontamination of Heavy Metals Processes Mechanisms and Applications tackles the subject of heavy metals in the environment with special emphasis on their treatment removal recovery disposal management and modeling Concepts Cutting Edge Technologies and Applications The book provides in depth coverage of the major hazardous heavy metals that are found in water land and facilities and that have significant effects on public health and the environment After an overview of heavy metal contamination the text reviews the concepts and technologies of pollution prevention It then examines technologies for metal decontamination ranging from precipitation which is the most commonly used to cutting edge technologies such as precipitation crystallization ion exchange membrane filtration and electrolysis Mathematical models for metal removal and recovery are also included Develop a Feasible Total Heavy Metal Control Program Complementing other books in the Advances in Industrial and Hazardous Wastes Treatment series this volume presents important research related to the remediation of heavy metals Extensive references are included for readers who want to trace duplicate or improve on a specific industrial hazardous waste treatment practice A comprehensive handbook for environmental professionals researchers and students it provides technical information to help readers develop a feasible total metal control program that can benefit both industry and local municipalities

Binding, Transport and Storage of Metal Ions in Biological Cells Wolfgang Maret, Anthony Wedd, 2014-07-30 Metal ions play key roles in biology Many are essential for catalysis for electron transfer and for the fixation sensing and metabolism of gases Others compete with those essential metal ions or have toxic or pharmacological effects This book is structured around the periodic table and focuses on the control of metal ions in cells It addresses the molecular aspects of binding transport and storage that ensure balanced levels of the essential elements Organisms have also developed mechanisms to deal with the non essential metal ions However through new uses and manufacturing processes organisms are increasingly exposed to changing levels of both essential and non essential ions in

new chemical forms They may not have developed defenses against some of these forms such as nanoparticles Many diseases such as cancer diabetes and neurodegeneration are associated with metal ion imbalance There may be a deficiency of the essential metals overload of either essential or non essential metals or perturbation of the overall natural balance This book is the first to comprehensively survey the molecular nature of the overall natural balance of metal ions in nutrition toxicology and pharmacology It is written as an introduction to research for students and researchers in academia and industry and begins with a chapter by Professor R J P Williams FRS

**Handbook on the Toxicology of Metals: Specific metals** ,1986 **Speciation Studies in Soil, Sediment and Environmental Samples** Sezgin Bakirdere, 2013-09-26 Recent developments clearly indicate that speciation studies in biological and environmental matrices are much more important than the total element determination due to the tremendous difference in bioavailability and toxicity of various chemical forms of a particular element Different separation detection techniques and hyphenated systems each with its own advantages and disadvantages with respect to precision sensitivity and detection limit have been developed for the identification and quantification of the species present in systems at ultra trace levels This book aims to evaluate the speciation analysis in depth and present a comprehensive review of state of the art analytical approaches used for the speciation of elements in environmental samples

**Water Treatment Technologies for the Removal of High-Toxicity Pollutants** Miroslava Václavíková, Ksenija Vitale, G.P. Gallios, Lucia Ivanicová, 2009-11-24 Water is essential for life a strategic resource for every country and population Its availability and sanitary safety is highly connected with the health and economy

status of population Burden of disease due to polluted water is a major public health problem throughout the world Many pollutants in water streams have been identified as toxic and harmful to the environment and human health and among them arsenic mercury and cadmium are considered as high priority ones Providing population with safe drinking water became the priority and at the same time a big challenge for the modern society Many funding agencies in various countries have assigned a high priority to the environmental security and pollution prevention UN being one of them launched the International Decade for Action Water for life 2005 2015 Therefore today's political and social climate presents an important opportunity to implement principles of sustainable development and to preserve resources essential for future life This process requires interdisciplinary approach it is critically important to stimulate interactions between medical doctors chemists physicist materials scientists engineers and policy makers which are already experienced in their specific areas It is also our ethical obligation to preserve existing water resources and existing eco systems enhancing their biodiversity The NATO Advanced Research Workshop Water Treatment Technologies for the Removal of High Toxicity Pollutants took place on September 13 17 2008 in Košice Slovak Republic
