Better Homes and Gardens ,1990 *Developing a Test Method for a Very Severe Hail Rating for Low Slope Roofing Assemblies* Daniel E. Brown,Daniel A. Boardman,2015 Increased property damage from hail impact has become more common in recent years with a majority of the damage occurring to roofs To help address this concern a very severe hail VSH rating for low slope roofing is being developed This work is being done using a modified version of the existing test method described in ANSI FM 4473 American National Standard for Impact Resistance Testing of Rigid Roofing Materials by Impacting with Freezer Ice Balls During this first phase of development samples of single ply built up and modified bitumen low slope roof assemblies were subjected to impacts from 2 0 in 51 mm diameter freezer ice balls with impact energies between 23 75 and 26 13 ft lbf 32 2 and 35 5 J These impact energies are nearly double the 14 95 ft lbf 19 J kinetic energy delivered by the 2 0 in 51 mm diameter steel balls currently used in the severe hail rating test in FM Approvals Standard Number 4470 Of utmost importance to this study was evaluating the appropriateness of using freezer ice balls with the less rigid materials more commonly found in low slope roofing Following the procedures in ANSI FM 4473 each impact location was subjected to two ice ball impacts Samples were impacted at seam locations over metal plates where applicable and in the field of the roof sample in order to determine if any currently FM approved severe hail rated roofing assemblies could meet the pass criteria The samples were evaluated for surface cracking and damage as well as for damage to the substrate insulation or coverboard Although the validity of using ice balls for impacting roofing samples has previously been demonstrated the testing conducted in this study has shown the ability of ice balls to be used in granting a more severe hail rating than is currently available for low slope roofing *Hail Resistance of Roofing Products* Sidney H. Greenfeld,1969 A test was developed for evaluating the hail resistance of roofings in which synthetic hail stones ice spheres of various sizes were shot at roof assemblies at their free fall terminal velocities Indentations granule loss and roofing fracture were observed The following conclusions have been made from these results All roofing materials have some resistance to hail damage but as the size of the hail increases a level of impact energy is reached at which damage occurs This level lies in the range of 1 1 2 to 2 inch 3 8 5 1 cm hailstones for most prepared roofings Because of the ways in which prepared roofings are applied most products have areas of different vulnerability The solidly supported areas of roofing tend to be the most resistant to hail damage Heavier shingles tend to be more hail resistant than Type 235 shingles Weathering tends to lower the hail resistance of asphalt shingles Built up roofs on dense substrates tend to resist hail better than those on soft substrates Built up roofs made with inorganic felts tend to be more hail resistant than those made with organic felts Coarse aggregate surfacing tends to increase the hail resistance of roofing *Installation, Care, and Maintenance of Wood Shake and Shingle Roofs* ,2011 This article gives general guidelines for selection installation finishing and maintenance of wood shake and shingle roofs The authors have gathered information from a variety of sources research publications on wood
