Food Biotechnology—1 R. D. King, 2012-12-06 Biotechnology in its many guises has developed very considerably over the last few years We now feel that it is appropriate for the publication of a series of books that discuss the technical aspects of biotechnology specifically as applied to foods and in particular concentrating on new and emerging techniques processes and products Food is without doubt one of the oldest bioindustries however some of the new areas of biotechnology such as diagnostic and health care applications are likely to mature much faster than applications in the food industry Eventually however biotechnology must have a very great impact on a wide scale in the food industry simply because of the size and diversity of the industry and because most food products are substantially natural in origin and are therefore very suitable for processing by biocatalysts Some of the ways in which the food industry is likely to be affected by developments in biotechnology include the following The modification of food components to give products with new and or improved properties for instance high fructose corn syrups and by modifying the functional properties of proteins New methods of assaying food constituents such as immobilized enzyme sensors New processes for the production of foods and food components for instance the use of plant cell cultures for the production of flavours Many of these topics will be described in detail in this series of books

Food Hydrocolloids Yapeng Fang, Hongbin Zhang, Katsuyoshi Nishinari, 2021-05-18 The book introduces the definition classification source and structure of hydrocolloids and provides a comprehensive description of their functionalities and food related applications The emphasis is put on the basic concepts and mechanisms underlying functionalities and the new developments in fundamental knowledge and practice The book

would be useful for students or professionals working in the fields of food science technology and biopolymers etc It would help to organize hydrocolloids knowledge in a more systematic framework and enlighten further profound investigations

Food Gels Peter Harris, 2012-12-06 The food technologist who wishes to produce a gelled product is faced with two basic options for achieving the desired effect whether to use a protein or a polysaccharide Although a gel can be formed by either a protein or a polysaccharide the resultant gels have different characteristics Polysaccharide gels are characterised by their fine texture and transparency which is achieved at a low polymer concentration They can be formed by heating and cooling pH adjustment or specific ion addition Protein gels are characterised by a higher polymer concentration 5-10% and are formed almost exclusively by heat denaturation Before reaching a final decision the technologist must take a number of factors into consideration The purpose of this book is to help the technologist in his choice by providing fundamental practical information in one book on the properties of gels and factors which influence them for both types of biopolymer To help the reader each chapter is wherever possible organised in the same way so that for example information on structure will always be available in section 2 The examples in the Applications section of each chapter are not meant to be exhaustive but to illustrate the various ways in which the particular polymer can be used to form a gelled product
