5 Final drive chain adjustment check

Adjustment of the final drive chain is achieved by means of drawbolts which are threaded into brackets which fit over each end of the rear wheel spindle. When in correct adjustment, the final drive chain should have 19 mm (0.75 in) of free movement with the rider seated on the machine, or 44 mm (1.75 in) with the machine placed on its centre stand. Any measurement of free movement must be made at the mid-point of the chain lower run and several measurements should be made whilst rotating the rear wheel in order to determine the tightest point in the chain.

If the chain is too slack, then the wheel spindle retaining nut should be loosened and the wheel drawn rearwards by means of the drawbolts until chain tension is correct. Before attempting to rotate each of the drawbolts, slacken their locknuts. Where the machine is fitted with a rear drum brake, loosen the nut which retains the torque rod to the brake backplate. Make sure that both drawbolts are rotated an equal amount or the wheels will become out of track.

Nip tight the wheel spindle retaining nut; on drum brake models, apply the brake pedal to centralise the brake backplate before doing this. Recheck the chain adjustment and if there is any doubt about the wheel alignment, check by placing a straight plank of wood parallel to the machine, so that it touches both walls of the rear tyre. If wheel alignment is correct, it should be equidistant from either side of the front wheel tyre, when tested on both sides of the rear wheel; it will not touch the front tyre because this tyre has a smaller cross section.

Finally, tighten the wheel spindle retaining nut to the specified torque loading, lock the drawbolts in position by tightening their locknuts and, on drum brake models, retighten the torque rod retaining nut. Before taking the machine onto the road, roll the machine forward and apply the rear brake to ensure that it is functioning correctly.

6 Final drive chain lubrication

Although a satisfactory result can be achieved without removing the chain from the machine by using one of the

special chain lubricant aerosols, it is better to remove the chain at regular intervals for more detailed attention. Refer to Section 14 of Chapter 7 for the relevant details.

1 Engine oil change

The oil-in-frame reservoir holds approximately 2.27 lit (4.0/4.8 imp/US pints) of SAE 20W/50 engine oil, so it is necessary to place a receptacle capable of holding more than this amount under the drain plug at the base of the frame reservoir. It is preferable to drain the oil whilst it is hot, so that it will be more fluid and thus drain off much more easily. Remove the filler cap, and the hexagon headed drain plug from the centre of the reservoir base plate and allow the oil to drain. Whilst the oil is draining, check the sealing washer beneath the head of the drain plug for damage or deterioration and renew it if necessary.

On completion of the oil draining, remove the four nuts with spring washers that retain the reservoir base plate so that it too can be detached and the gauze filter cleaned with petrol. Any stubborn traces of contamination blocking the gauze can be removed by brushing the affected area with a small brush soaked in petrol; a used toothbrush is ideal. Remember to take the necessary fire precautions when carrying out this cleaning procedure and always wear eye protection against any petrol that may spray back from the brush. On completion of cleaning, closely inspect the gauze area for any splits or holes that will allow the passage of sediment through it and into the oil system. Renew the gauze filter if it is in any way defective. Flush out the reservoir with new flushing oil, then refill the base plate, not forgetting the two gaskets which fit each side of the filter flange. If damaged, they should be renewed, to prevent a permanent oil leak occurring. Check also that the four spring washers have not become flattened. If this is the case, then renew them as they will have lost their locking function.

Tighten the base plate retaining nuts, evenly and in a diagonal sequence so as to avoid distortion of the plate, and then refit the drain plug with its serviceable sealing washer. Refill the reservoir with the specified amount of oil and allow time for it to settle before checking its level with the dipstick which is integral with the filler cap. Before refitting the filler cap, start the engine and allow it to idle for a few minutes until oil is seen to be returning to the reservoir.
