Directions

Suspend 38 grams of M238 or 48 grams of M370 or 57 grams of M346 in 1000 ml distilled water. Heat to boiling to dissolve the medium completely. Dispense in test tubes, taking care to distribute calcium carbonate evenly. Sterilize by autoclaving at 15 lbs pressure (121°C) for 15 minutes. Shake the tubes and place them to cool in a slanted position so as to keep the calcium carbonate in suspension.

Note: Due to presence of calcium carbonate, the prepared medium forms opalescent solution with white precipitate.

Principle and Interpretation

Acetobacter species are aerobic, gram-negative organisms. Under acidic conditions they oxidize ethanol to acetic acid. These are used in making vinegar. Acetic acid bacteria are found in fruits with high carbohydrate concentration, which is selective for yeasts that produce ethanol. This ethanol forms the substrate for acetic acid bacteria and may oxidize ethanol to acetic acid (1). Various synthetic and maintenance media for Acetobacter cultures have been cited (2). A typical maintenance medium is Acetobacter Agar (2) Acetobacter Agar is formulated as per Manual of Microbiological Methods (3) and used for the maintenance of Acetobacter species utilizing glucose or mannitol (4).

Peptic digest of animal tissue/ casein enzymic hydrolysate, yeast extract/ liver extract in the medium provides nitrogen, vitamins and minerals necessary to support bacterial growth. Glucose and mannitol acts as energy source. Calcium carbonate acts as a buffer.
