

Height of centre of gravity

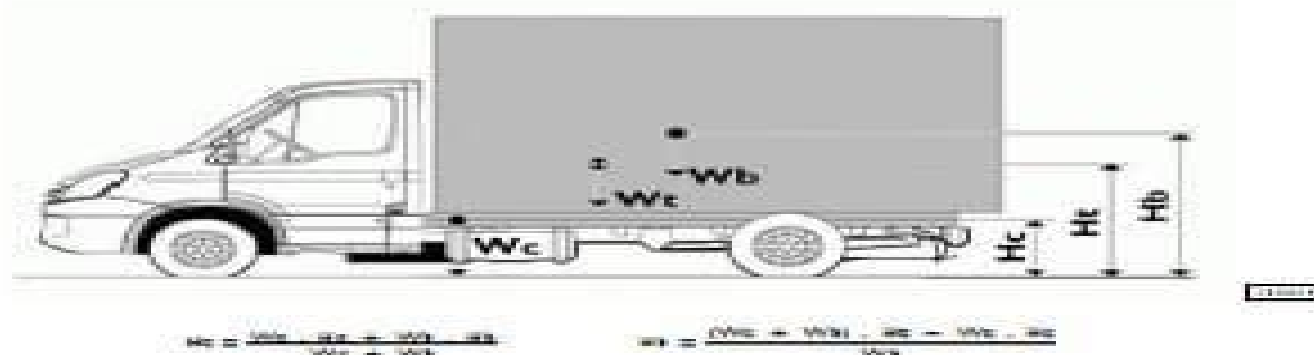

The height of the centre of gravity of the chassis cab is given in the technical documentation specific to each model (chassis drawing).

For testing the vehicle complete with superstructure, the bodybuilder must check that the height of the centre of gravity of the equipment including the payload, or of the entire vehicle when fully loaded, falls within the maximum permitted values.

These limits are defined in compliance with the national or international regulations (e.g. EC Directive regarding braking) or requested by the Manufacturer to ensure good handling of the vehicle (e.g. transverse stability of the moving vehicle).

Figure 1-4

Verification with full load:

W_c = Chassis cab vehicle kerb weight

H_c = Height of centre of gravity of chassis cab vehicle (kerb condition)

W_b = Body and payload

H_b = Height of centre of gravity of body and payload relative to ground

W_{cb} = Vehicle weight when fully loaded

H_{cb} = Height of centre of gravity of vehicle with full load

To check the vehicle with its body but no payload, use the above formula but for W_b use only the vehicle chassis weight. (The position for H_b will depend on the load and deflection of the suspension).

The height of the centre of gravity indicated in Table 1-6 represents values which are not to be exceeded for each given equipment level. These values have been calculated only in terms of the transverse stability of the vehicle and are applicable to a rigid wheelbase. Any other possible restrictive specification, e.g. braking regulation, should be taken into consideration.

The values given in Table 1-6 refer to the body with fixed payload. In versions where the payload tends to move sideways (e.g. suspended loads, fluid loads etc.) especially when turning, higher dynamic transverse forces are generated which makes the vehicle less stable. This must be taken into consideration when providing vehicle operating instructions or for possible reduction in the height of the centre of gravity.
