Chemical bonding is the process by which atoms form chemical compounds by sharing or transferring electrons. Understanding chemical bonding is crucial in chemistry, as it explains the stability and reactivity of different substances.

Why do atoms lose, gain or share electrons (why do atoms bond)? to become more stable.

Duet Rule

The duet rule states that atoms of hydrogen (H) and helium (He) are most stable when they have 2 electrons in their valence shell.

Octet

Rule

The octet rule states that atoms, other than hydrogen and helium, are most stable when they have 8 electrons in their valence shell.

Determine whether the following atoms have a stable duet or octet configuration:

- Lithium (Li)
- Neon (Ne)
- Fluorine (F)
