

Guided Article review 1 Answers

- 1) **What was the primary research question?**
 - The primary research question is the "truth effect" and whether it can be observed with conspiracy statements (would the truth effects extend to conspiracy statements). If so, would the effect be smaller than typical truth effect and would it be associated with differences like cognitive style and conspiracy mentality?
- 2) **What was independent variable used in the study?**
 - The independent variable used in the study was repetition
- 3) **Describe how conspiracy mentality was measure?**
 - Conspiracy mentality was measured by participants indicating how likely they thought the five statements were on a 5-point Likert scale, for each individual participant, the experimenters would compute the mean response, the higher the score, it means and indicates a higher conspiracy mentality.
- 4) **What were the main results**
 - The main results were that after conducting all the methods it was concluded that repetition was a way to increase belief in conspiracy theories
- 5) **According to the researches, what was one explanation for why the truth effect was smaller for conspiracy than trivia statements?**
 - The explanation was that trivia statements were more often judged than conspiracy statements and these main effects were qualified by a two-way interaction. The two-way interaction was between repetition and materials. The researchers conducted comparisons based on full model in each materials condition. Trivia statements, "true" responses were more frequent when repeated compared to when they were new. Using repetition was also significant for conspiracy statements. The truth effect was significant for both trivia and conspiracy statements but were larger in trivia statements and that's why the truth effect was smaller in conspiracy statements.
