Computer Organization and Design David A. Patterson, John L. Hennessy, 2004-08-07

This best selling text on computer organization has been thoroughly updated to reflect the newest technologies. Examples highlight the latest processor designs, benchmarking standards, languages and tools. As with previous editions, a MIPS processor is the core used to present the fundamentals of hardware technologies at work in a computer system. The book presents an entire MIPS instruction set, instruction by instruction, the fundamentals of assembly language, computer arithmetic, pipelining, memory hierarchies, and I/O. A new aspect of the third edition is the explicit connection between program performance and CPU performance. The authors show how hardware and software components such as the specific algorithm, programming language, compiler, ISA, and processor implementation impact program performance. Throughout the book, a new feature focusing on program performance describes how to search for bottlenecks and improve performance in various parts of the system. The book digs deeper into the hardware/software interface, presenting a complete view of the function of the programming language and compiler, crucial for understanding computer organization. A CD provides a toolkit of simulators and compilers along with tutorials for using them. For instructor resources, click on the grey companion site button found on the right side of this page. This new edition represents a major revision. New to this edition: Entire Text has been updated to reflect new technology; 70% new exercises; Includes a CD loaded with software projects and exercises to support courses using a number of tools; A new interior design presents defined terms in the margin for quick reference; A new feature, Understanding Program Performance, focuses on performance from the programmer's perspective; Two sets of exercises and solutions, For More Practice and In More Depth, are included on the CD; Check Yourself questions help students check their understanding of major concepts; Computers In the Real World feature illustrates the diversity of uses for information technology. More detail below.

Embedded SoPC Design with Nios II Processor and VHDL Examples

Pong P. Chu, 2011-08-29. The book is divided into four major parts. Part I covers HDL constructs and synthesis of basic digital circuits. Part II provides an overview of embedded software development with the emphasis on low-level I/O access and drivers. Part III demonstrates the design and development of hardware and software for several complex I/O peripherals, including PS2 keyboard and mouse, a graphic video controller, an audio codec, and an SD secure digital card. Part IV provides three case studies of the integration of hardware accelerators, including a custom GCD (greatest common divisor) circuit, a Mandelbrot set fractal circuit, and an audio synthesizer based on DDFS (direct digital frequency synthesis) methodology. The book utilizes FPGA devices, Nios II soft-core processor, and development platform from Altera Co., which is one of the two main FPGA manufacturers. Altera has a generous university program that provides free software and discounted prototyping boards for educational institutions; details at www.altera.com/university. The two main educational prototyping boards are known as DE1-99 and DE2-69. All experiments can be implemented and tested with these boards. A board combined with this book becomes a turn-key solution for the SoPC design experiments and projects. Most HDL and C codes in the book are device-independent and can be adapted by other prototyping boards as long as a board has similar I/O configuration. *Electronic*
