Heraeus Biofuge Manual:

Molecular Microbial Ecology Manual A.D. Akkermans, Jan Dirk van Elsas, F.J. de Bruijn, 2012-12-06 For a long time microbial ecology has been developed as a distinct field within Ecology. In spite of the important role of microorganisms in the environment, this group of invisible organisms remained inaccessible to other ecologists. Detection and identification of microorganisms remain largely dependent on isolation techniques and characterisation of pure cultures. We now realise that only a minor fraction of the microbial community can be cultivated. As a result of the introduction of molecular methods, microbes can now be detected and identified at the DNA/RNA level in their natural environment. This has opened a new field in ecology. *Molecular Microbial Ecology*. In the present manual, we aim to introduce the microbial ecologist to a selected number of current molecular techniques that are relevant in microbial ecology. The first edition of the manual contains 33 chapters, and an equal number of additional chapters will be added this year. Since the field of molecular ecology is in a continuous progress, we aim to update and extend the Manual regularly and will invite anyone to deposit their new protocols in full detail in the next edition of this Manual.

Wine Fermentation Harald Claus, 2019-03-28 Wineries are facing new challenges due to actual market demands for the creation of products exhibiting more particular flavors. In addition, climate change has led to the requirement for grape varieties with specific features such as convenient maturation times, enhanced tolerance towards dryness, osmotic stress, and resistance against plant pathogens. The next generation of yeast starter cultures should produce wines with an appealing sensory profile and less alcohol. This Special Issue comprises actual studies addressing some of the problems and solutions for the environmental, technical, and consumer challenges of wine making today. Development of sophisticated mass spectroscopic methods enable the identification of the major metabolite spectrum of grapes, wine, and deliver detailed insights in terroir and yeast-specific traits. Knowledge of the origin and reactions of reductive sulphur compounds facilitates the avoidance of unpleasant wine odors. Innovative physical-chemical treatments support effective and sustainable color extraction from red grape varieties. Enological enzymes from yeasts used directly or in the form of starter cultures are promising tools to increase the juice yields, color intensity, and aroma of wine. Natural and artificial *Saccharomyces* hybrids as well as collections of adapted wild isolates from various ecological niches will extend winemakers' repertoire, allowing individual fermentations. Exact process control of wine fermentations by convenient computer programs will guarantee consistently high product quality.

Recombinant Antibodies for Cancer Therapy Martin Welschof, Jürgen Krauss, 2008-02-05 Since the advent of hybridoma technology more than two decades ago numerous antibodies have entered the clinical setting as potent therapeutic agents Their repeated application in humans however is limited by the development of human antimouse antibodies HAMA in the recipient leading to allergic reactions against the foreign murine protein and rapid neutralization To circumvent these limitations many new antibodies have recently been tailored through recombinant antibody technology The initial clinical data show encouraging results thus demonstrating the potential of these new therapeutic agents The purpose of Recombinant Antibodies for Cancer Therapy is to present a collection of detailed protocols in recombinant antibody technology It is primarily addressed to scientists working on recombinant antibodies as well as clinicians involved with antibody based therapies As with other volumes of this series we placed the main focus on providing detailed protocols describing procedures step by step Moreover each protocol supplies a troubleshooting guide containing detailed information on possible problems and hints for potential solutions Antibody technology is a subject of constant and rapid change This volume therefore does not attempt to cover all possible current experimental approaches in the field Rather we present carefully selected protocols written by competent authors who have successfully verified the particular method described Given our own

professional backgrounds and interest in oncology we chose to concentrate chiefly on therapeutic agents for cancer patients
