

## Capacitance DF Bridge Model TCB-100

- A compact instrument for precise determination of capacitance and dissipation factor (power factor).
- An important tool for preventive maintenance, production testing, cable fault finding.
- Extremely useful for measuring dielectric properties of power transformers, bushings, cables, motors and breakers.
- Wide Range (10pF - 100µF)

### Exact Results

By the use of a well proven transformer ratio-arm design, we have produced a bridge which guarantees measurements in conditions that are beyond the scope of most commercial Capacitance Bridges.

Test sites, such as high voltage switch yards, transformer stations, and production sites with a high presence of electromagnetic interference present no problem to this instrument. Measurements on three or four terminal devices can be made without calculation by the use of the built-in system.

The low voltage test set is designed to test electrical insulation systems in the laboratory, substation or

maintenance shop, without the danger associated with a high voltage test set.

Readings are in "pF" with decimal multiplication only. A unique selector switch allows selection of all possible combinations without changing the initial front-panel connection for the test under test.

An extremely sensitive null detector is sharply tuned to the test frequency. It also reads line frequency interference voltages.

The test set is easy to use and requires no calculation or complicated multiplication of readings.
