Methods and Concepts for Designing and Validating Smart Grid Systems Thomas I. Strasser, Sebastian Rohjans, Graeme M. Burt, 2019-11-20 Energy efficiency and low carbon technologies are key contributors to curtailing the emission of greenhouse gases that continue to cause global warming The efforts to reduce greenhouse gas emissions also strongly affect electrical power systems Renewable sources storage systems and flexible loads provide new system controls but power system operators and utilities have to deal with their fluctuating nature limited storage capabilities and typically higher infrastructure complexity with a growing number of heterogeneous components In addition to the technological change of new components the liberalization of energy markets and new regulatory rules bring contextual change that necessitates the

restructuring of the design and operation of future energy systems Sophisticated component design methods intelligent information and communication architectures automation and control concepts new and advanced markets as well as proper standards are necessary in order to manage the higher complexity of such intelligent power systems that form smart grids Due to the considerably higher complexity of such cyber physical energy systems constituting the power system automation protection information and communication technology ICT and system services it is expected that the design and validation of smart grid configurations will play a major role in future technology and system developments However an integrated approach for the design and evaluation of smart grid configurations incorporating these diverse constituent parts remains evasive The currently available validation approaches focus mainly on component oriented methods In order to guarantee a sustainable affordable and secure supply of electricity through the transition to a future smart grid with considerably higher complexity and innovation new design validation and testing methods appropriate for cyber physical systems are required Therefore this book summarizes recent research results and developments related to the design and validation of smart grid systems

INDUSTRIA, ITALIA Riccardo Gallo, 2020-09-01 L'industria italiana sta ragionando su cosa fare per superare la terribile caduta provocata dall'epidemia. Alla precedente e meno grave crisi globale del 2008 l'industria aveva risposto con nuove tecnologie, prodotti, riorganizzazione delle fabbriche, acquisizioni e fusioni. Aveva recuperato solo in parte. Con poca guida di politica industriale. Già prima dell'epidemia il quadro generale stava cambiando. Stava finendo l'era della globalizzazione. La quarta rivoluzione industriale divampava. In Italia l'occupazione non soffriva numericamente ma il lavoro si era dequalificato. La fermata del mondo nella primavera del 2020 ha drammatizzato le cose. Sarà difficile per le imprese rispondere a questa caduta con le proprie forze. Sarà erosa la loro liquidità ma il problema non finanziario, cioè non si risolve con i soldi pubblici. Il problema strategico ed esistenziale. Il digitale faciliterebbe il trasferimento tecnologico alle imprese, anche piccole, e consentirebbe loro di partecipare al progresso. Ma l'Italia è molto indietro anche in questo. Per investire in competenze, ritrovare il valore del merito, recuperare posizioni nel ranking mondiale occorrerebbero un progetto, competitività serio e di legislatura, e uno qui definito Missionari tecnologici. Con questo volume Sapienza Università di Roma offre il suo contributo sociale, culturale ed economico. Il volume è stato curato da Riccardo Gallo con i contributi di Daniela Addressi, Roberto Adrower, Giuseppe Bonifazi, Marco Bravi, Mario Calabrese, Cinzia Capalbo, Alessandro Corsini, Antonio d'Alessandro, Paolo De Filippis, Luca Di Palma, Fabio M. Frattale, Mascioli, Riccardo Gallo, Damiano Garofalo, Carlo Martino, Franco Medici, Francesco Napolitano, Cristiana Piccioni, Daniela Pilone, Massimo Pompili, Antonello Rizzi, Aldo Roveri, Nicola Roveri, Giovanni Solimine.
