

CHAPTER 26

Scheduling Manufacturing Systems

STEPHAN BECKER and RALF FARR
Technical University of Hamburg-Harburg

26.1 PROBLEM IDENTIFICATION

Scheduling is concerned with determining when, and using which, resources, jobs or orders in a factory when they are competing for the same resources (machines, tools, materials, personnel, etc.). This determination is essential for the operative part of any production planning system.

The importance of scheduling is a consequence of the demand trend to increase product variety which results in decreasing lot size, an adverse side-effect. Behind this trend lies the intention to shoulder the requirements of the market with more flexibility of the production. The main idea behind the JIT philosophy (Just-In-Time). Besides flexibility, cost reduction is also an objective of JIT. JIT aims at the reduction of stock which, traditionally, served not only to provide enough products to satisfy the market demand but also served as a buffer between different production stages (or workcells). With or without drastically reduced buffers, graceful interaction between different production processes becomes a must. This interaction again creates the role of scheduling.

However, scheduling is not a stand-alone process, but a process which is finished once executed. Instead, it is an ongoing process, highly dependent on current data in order to react to unforeseen events that might disturb the current schedule. Figure 26.1 shows scheduling as a part of a closed feedback loop together with production control and production processes. As scheduling takes place in a complex and rapidly changing environment, it is a demanding task. Better method dynamic scheduling. In effect, the efficiency and accuracy of schedules have an important impact on the success of an enterprise. Though not being the only factor, scheduling is one of the key factors used to gain flexibility and to reduce costs.

In literature as well as in the factory, the terms *planning*, *scheduling* and *dynamic scheduling* are often used as synonyms, though each has a different meaning. Therefore, clarification of the terminology is necessary. Besides the definition of basic terms, the characterization of scheduling, based upon the three dimensions, *time horizon*, *production scope* and *optimal method*, has proved to be very useful and will be discussed. The final concept of section 26.2 is the representation of decision-making; therefore, GSAI nets are introduced.

Scheduling problems is a highly complex task; for example, for an subsequence of orders, $n = 8$ to be scheduled for $m = 3$ sequential machines, the number of possible schedules is, according to $y = y(n, m) = 8! = 65,000,000,000,000$. If a computer needs only 9.3 msec to compute a schedule and to evaluate it, about 205 years would be required to review all schedules. In complexity theory, the scheduling problem is known to be NP-complete; it is not likely that there exists an algorithm which can solve the problem with a time requirement not higher than a polynomial on the number of variables. Thus, it is not possible to find the optimal schedule for realistic problems by mere calculation. Instead, the task of a scheduler is to compute a good schedule; that is, a schedule which at least satisfies the most important objectives at hand. A number of methods to reduce the set of possible solutions with respect to certain objectives is commonly used. Sections 26.4 and 26.6 present some OR (Operation Research) and AI (Artificial Intelligence) methods for solving the scheduling problem. Examples of current implementation are given in section 26.5. They illustrate the use of both OR and AI techniques. Finally, section 26.6 discusses some pros and cons of the AI and the OR approach to scheduling.

DeGarmo's Materials and Processes in Manufacturing Ernest Paul DeGarmo, J. T. Black, Ronald A. Kohser, 2011-08-30 Now in its eleventh edition DeGarmo s Materials and Processes in Manufacturing has been a market leading text on manufacturing and manufacturing processes courses for more than fifty years Authors J T Black and Ron Kohser have continued this book s long and distinguished tradition of exceedingly clear presentation and highly practical approach to materials and processes presenting mathematical models and analytical equations only when they enhance the basic understanding of the material Completely revised and updated to reflect all current practices standards and materials the eleventh edition has new coverage of additive manufacturing lean engineering and processes related to ceramics polymers and plastics

Manufacturing Automation Management Roger W. Bolz, 2012-12-06 Automation has been employed for many years to provide a multitude of reasonably priced products for the American consumer However it has become evident that its real character as a manufacturing systems approach needs to be examined carefully for a better appreciation In this book the purpose is to examine automation technology in its broadest sense and develop not only an understanding but also present some of the engineering and organization know how by which manufacturing management can more effectively utilize automation to improve productivity and combat rising costs in the years ahead Fundamentally this book is addressed to manufacturing managers and the material presented in a manner that will provide the knowledge for assuring success in automating In addition it highlights the manufacturing research and long range planning that will be required for creating the new manufacturing technology so necessary for assuring success in future automation efforts One of the

important facts emphasized in this text is that automation is not merely robotics or another kind or type of machinery. To effect true productivity improvement requires a fresh look at the entire production process or facility as a completely integrated system. With the developments of the past few years, rapid advances in the technology and the tools of automation have brought this imperative goal within the reasonable grasp of manufacturing management in almost every segment of industry. However, to utilize this progress it is necessary to acquire a working understanding of all facets of automation.

Encyclopedia of Production and Manufacturing Management Paul M. Swamidass, 2006-09-21. The Encyclopedia of Production and Manufacturing Management is an encyclopedia that has been developed to serve this field as the fundamental reference work. Over the past twenty years, the field of production and operations management has grown more rapidly than ever, and consequently its boundaries have been stretched in all directions. For example, in the last two decades, production and manufacturing management absorbed in rapid succession several new production management concepts: manufacturing strategy, focused factory, just in time, manufacturing concurrent engineering, total quality management, supply chain management, flexible manufacturing systems, lean production, and mass customization, to name a few. This explosive growth makes the need for this volume abundantly clear. The manufacturing industry thinks and acts more broadly than it did several decades ago. The most notable change has been the need for manufacturing managers to think in technological, strategic, and competitive terms. This is a very favorable development, and it leads to manufacturing success. The entries in this encyclopedia include the most recent technical and strategic innovations in production and manufacturing management. The encyclopedia consists of articles of varying lengths. The longer articles on important concepts and practices range from five to fifteen pages. There are about 100 such articles written by nearly 100 authors from around the world. In addition, there are over 1000 shorter entries on concepts, practices, and principles. The range of topics and depth of coverage is intended to suit both student and professional audiences. The shorter entries provide digests of unfamiliar and complicated subjects. Difficult subjects are made intelligible to the reader without oversimplification. The strategic and technological perspectives on various topics give this Encyclopedia its distinctiveness and uniqueness. The world of manufacturing today is increasingly competitive. It is apparent that manufacturers must respond to these competitive pressures with technical and strategic innovation. This encyclopedia has been developed to help researchers, students, and those in the manufacturing industry to understand and implement these ongoing changes in the field.

Using the Engineering Literature Bonnie A. Osif, 2016-04-19. With the encroachment of the Internet into nearly all aspects of work and life, it seems as though information is everywhere. However, there is information, and then there is correct, appropriate, and timely information. While we might love being able to turn to Wikipedia for encyclopedia-like information or search Google for the thousands of links.
