System Identification of Stochastic Nonlinear Dynamic Systems using Takagi-Sugeno Fuzzy Models Salman Zaidi, 2019-02-22 Some novel approaches to estimate Nonlinear Output Error NOE models using TS fuzzy models for a class of nonlinear dynamic systems having variability in their outputs is presented in this dissertation Instead of using unrealistic assumptions about uncertainty the most common of which is normality the proposed methodology tends to capture effects caused by the real uncertainty observed in the data The methodology requires that the identification method must be repeated offline a number of times under similar conditions This leads to multiple inputoutput time series from the underlying system These time series are preprocessed using the techniques of statistics and probability theory to generate the envelopes of response at each time instant By incorporating interval data in fuzzy modelling and using the theory of symbolic interval valued data a TS fuzzy model with interval antecedent and consequent parameters is obtained The proposed identification algorithm provides for a model for predicting the center valued response as well as envelopes as the measure of uncertainty in system output

Cooperative Control of Networked Vehicles Alexander Schwab, 2022-08-29 This thesis concerns the cooperative control of networked vehicles. Autonomous driving is a topic that is currently being discussed with great interest from researchers, vehicle manufacturers and the corresponding media. Future autonomous vehicles should bring the passengers to their desired destination while improving both safety and efficiency compared to current human-driven vehicles. The inherent problem of all vehicle coordination tasks is to guarantee collision avoidance in every situation. To this end, autonomous vehicles have to share information with each other in order to perform traffic manoeuvres that require the cooperation of multiple vehicles. The fundamental problem of vehicle platooning is studied extensively, which describes the task of arranging a set of vehicles so that they drive with a common velocity and a prescribed distance. Local design objectives are derived that have to be satisfied by the vehicle controllers. In particular, it is shown that the vehicles have to be externally positive to achieve collision avoidance. As an abstraction from real traffic scenarios, swarms of networked vehicles are considered. The main difference between swarming and traffic problems is that a communication structure that has been appropriate in the beginning might become unsuited for the control task due to the relative movement of the vehicles. To solve this problem, this thesis proposes to use the Delaunay triangulation as a switching communication structure.

Logical Foundations of Cyber-Physical Systems André Platzer, 2018-07-30 Cyber physical systems (CPSs) combine cyber capabilities such as computation or communication with physical capabilities such as motion or other physical processes. Cars, aircraft and robots are prime examples because they move physically in space in a way that is determined by discrete computerized control algorithms. Designing these algorithms is challenging due to their tight coupling with physical behavior while it is vital that these algorithms be correct because we rely on them for safety-critical tasks. This textbook teaches undergraduate students the core principles behind CPSs. It shows them how to develop models and controls, identify safety specifications and critical properties, reason rigorously about CPS models, leverage multi-dynamical systems compositionality to tame CPS complexity, identify required control constraints, verify CPS models of appropriate scale in logic and develop an intuition for operational effects. The book is supported with homework exercises, lecture videos and slides.

Algorithmic Foundations of Robotics XIII Marco Morales, Lydia Tapia, Gildardo Sánchez-Ante, Seth Hutchinson, 2020-05-07 This book gathers the outcomes of the thirteenth Workshop on the Algorithmic Foundations of Robotics (WAFR), the premier event for showcasing cutting edge research on algorithmic robotics. The latest WAFR held at Universidad Politécnica de Yucatán in Mérida, México on December 9-11, 2018 continued this tradition. This book contains fifty-four papers presented at WAFR which highlight the

latest research on fundamental algorithmic robotics e.g. planning, learning, navigation, control, manipulation, optimality, completeness and complexity demonstrated through several applications involving multi-robot systems, perception and contact manipulation. Addressing a diverse range of topics in papers prepared by expert contributors, the book reflects the state of the art and outlines future directions in the field of algorithmic robotics.

Hybrid Systems, Optimal Control and Hybrid Vehicles Thomas J. Böhme, Benjamin Frank, 2017-02-01. This book assembles new methods showing the automotive engineer for the first time how hybrid vehicle configurations can be modeled as systems with discrete and continuous controls. These hybrid systems describe naturally and compactly the networks of embedded systems which use elements such as integrators, hysteresis, state machines and logical rules to describe the evolution of continuous and discrete dynamics and arise inevitably when modeling hybrid electric vehicles. They can throw light on systems which may otherwise be too complex or recondite. *Hybrid Systems, Optimal Control and Hybrid Vehicles* shows the reader how to formulate and solve control problems which satisfy multiple objectives which may be arbitrary and complex with contradictory influences on fuel consumption, emissions and drivability. The text introduces industrial engineers, postgraduates and researchers to the theory of hybrid optimal control problems. A series of novel algorithmic developments provides tools for solving engineering problems of growing complexity in the field of hybrid vehicles. Important topics of real relevance rarely found in text books and research publications, switching costs, sensitivity of discrete decisions and their impact on fuel savings etc. are discussed and supported with practical applications. These demonstrate the contribution of optimal hybrid control in predictive energy management, advanced powertrain calibration and the optimization of vehicle configuration with respect to fuel economy, lowest emissions and smoothest drivability. Numerical issues such as computing resources, simplifications and stability are treated to enable readers to assess such complex systems. To help industrial engineers and managers with project decision making, solutions for many important problems in hybrid vehicle control are provided in terms of requirements, benefits and risks.

Managed Software Evolution Ralf Reussner, Michael Goedicke, Wilhelm Hasselbring, Birgit Vogel-Heuser, Jan Keim, Lukas Martin, 2019-06-26. This open access book presents the outcomes of the Design for Future Managed Software Evolution priority program 1593 which was launched by the German Research Foundation (Deutsche Forschungsgemeinschaft DFG) to develop new approaches to software engineering with a specific focus on long-lived software systems. The different lifecycles of software and hardware platforms lead to interoperability problems in such systems. Instead of separating the development, adaptation and evolution of software and its platforms as well as aspects like operation, monitoring and maintenance, they should all be integrated into one overarching process. Accordingly, the book is split into three major parts, the first of which includes an introduction to the nature of software evolution followed by an overview of the specific challenges and a general introduction to the case studies used in the project. The second part of the book consists of the main chapters on knowledge-carrying software and covers tacit knowledge in software evolution.

continuous design decision support model based round trip engineering for software product lines performance analysis strategies maintaining security in software evolution learning from evolution for evolution and formal verification of evolutionary changes In turn the last part of the book presents key findings and spin offs The individual chapters there describe various case studies along with their benefits deliverables and the respective lessons learned An overview of future research topics rounds out the coverage The book was mainly written for scientific researchers and advanced professionals with an academic background They will benefit from its comprehensive treatment of various topics related to problems that are now gaining in importance given the higher costs for maintenance and evolution in comparison to the initial development and the fact that today most software is not developed from scratch but as part of a continuum of former and future releases

Hybrid System Identification Fabien Lauer, Gérard Bloch, 2018-10-04 Hybrid System Identification helps readers to build mathematical models of dynamical systems switching between different operating modes from their experimental observations It provides an overview of the interaction between system identification machine learning and pattern recognition fields in explaining and analysing hybrid system identification It emphasises the optimization and computational complexity issues that lie at the core of the problems considered and sets them aside from standard system identification problems The book presents practical methods that leverage this complexity as well as a broad view of state of the art machine learning methods The authors illustrate the key technical points using examples and figures to help the reader understand the material The book includes an in depth discussion and computational analysis of hybrid system identification problems moving from the basic questions of the definition of hybrid systems and system identification to methods of hybrid system identification and the estimation of switched linear affine and piecewise affine models The authors also give an overview of the various applications of hybrid systems discuss the connections to other fields and describe more advanced material on recursive state space and nonlinear hybrid system identification Hybrid System Identification includes a detailed exposition of major methods which allows researchers and practitioners to acquaint themselves rapidly with state of the art tools The book is also a sound basis for graduate and undergraduate students studying this area of control as the presentation and form of the book provides the background and coverage necessary for a full understanding of hybrid system identification whether the reader is initially familiar with system identification related to hybrid systems or not
