Nondestructive Evaluation of Wood Forest Service (U S), Forest Products Laboratory (U S), Robert J. Ross, 2015. Nature's engineering of wood through genetics, wind and weather creates a wide variability in wood as a material. Consequently, manufacture and users of wood products are frequently frustrated in dealing with the forest resource. Manufacturers sometimes argue that wood is difficult to consistently process into quality products because of the wide range of properties that exist in this raw material. Users of wood products can be equally frustrated with the performance variability found in finished products. Nondestructive evaluation (NDE) technologies have contributed significantly toward eliminating the cause of these frustrations. NDE technologies have been developed and are currently used in lumber and veneer grading programs that result in engineered materials that have consistent, well-defined performance characteristics. This brief volume explores some of the processes that are used to manufacture wood, including green wood technology, and provides a bit of history to wood production and its uses too.
