Information analysis centers were developed to help the scientist and practitioner cope with the ever increasing mass of published and unpublished information in a specific field Their establishment resulted from a further extension of those pressures that had brought about the formation of the specialized primary journal and the abstracting services at the turn of the century The information analysis center concept was greatly advanced by the 1963 report of the President s Science Advisory Committee Panel on Science Information This report stated scientific interpreters who can collect relevant data review a field and distill information in a manner that goes to the heart of a technical situation are more help to the overburdened specialist than is a mere pile of relevant documents Such specialized information centers are operated in closest possible contact with working scientists in the field These centers not only furnish information about ongoing research and disseminate and retrieve information but also create new information and develop new methods of information analysis synthesis and dissemination The continually expanding biomedical literature produced by scientists from the world s laboratories research centers and medical centers led the National Institute of Neurological Diseases and Stroke in 1964 to initiate a National Neurological Information Network of specialized centers for neurological information The Centers are designed to bring under control and to promote ready access to important segments of the literature **Observability and**

Observation in Physical Science Peter Kosso,2012-12-06 The concept of observability of entities in physical science is typically analyzed in terms of the nature and significance of a dichotomy between observables and unobservables In this book however this categorization is resisted and observability is analyzed in a descriptive way in terms of the information which one can receive through interaction with objects in the world The account of interaction and the transfer of information is done using applicable scientific theories In this way the question of observability of scientific entities is put to science itself Several examples are presented which show how this interaction information account of observability is done It is demonstrated that observability has many dimensions which are in general orthogonal The epistemic significance of these dimensions is explained This study is intended primarily as a method for understanding problems of observability rather than as a solution to those problems The important issue of scientific realism and its relation to observability however demands attention Hence the implication of the interaction information account for realism is drawn in terms of the epistemic significance of the dimensions of observability This amounts to specifying what it is about good observations that make them objective evidence for scientific theories Aerospace Medicine and Biology ,1987 A selection of annotated references to
