■ At idling

Turn the speed control lever (2) clockwise to idle the engine. It tensions the governor spring (3) to pull the fork lever (1).

When the fork lever (1) is pulled, it moves the torque spring pin (7) and the fork lever (1) in the direction of the arrow A to restrain the weight. In combination with the start spring tension, it is balanced with the centrifugal force of flywheel weight to keep idling.

■ At rated speed with full load and overload

As the speed control lever is changed from the middle speed to high speed, the governor spring tension increases to compress the torque spring and move the fork lever (1) in the direction of the arrow A.

The fork lever (1) moves until it reaches the output limiting bolt to keep rated rotation and rated output.

When the engine is overloaded, the engine rotating speed decreases and the centrifugal force of flywheel weight decreases. Then the torque spring moves the fork lever (1) in the direction of arrow A.

The control bolt moves in the direction that increases fuel supply to increase the output. It is balanced with the centrifugal force of the flywheel weight to produce low speed output (torque output).
