Graph Theoretic Methods In Multiagent Networks Graph Theoretic Methods In Multiagent Networks:

Graph Theoretic Methods in Multiagent Networks Mehran Mesbahi, Magnus Egerstedt, 2010-07-01 This accessible book provides an introduction to the analysis and design of dynamic multiagent networks. Such networks are of great interest in a wide range of areas in science and engineering including mobile sensor networks, distributed robotics such as formation flying and swarming, quantum networks, networked economics, biological synchronization, and social networks. Focusing on graph theoretic methods for the analysis and synthesis of dynamic multiagent networks, the book presents a powerful new formalism and set of tools for networked systems. The book's three sections look at foundations, multiagent networks, and networks as systems. The authors give an overview of important ideas from graph theory followed by a detailed account of the agreement protocol and its various extensions including the behavior of the protocol over undirected, directed, switching, and random networks. They cover topics such as formation control, coverage, distributed estimation, social networks, and games over networks. And they explore intriguing aspects of viewing networks as systems by making these networks amenable to control theoretic analysis and automatic synthesis by monitoring their dynamic evolution and by examining higher order interaction models in terms of simplicial complexes and their applications. The book will interest graduate students working in systems and control as well as in computer science and robotics. It will be a standard reference for researchers seeking a self-contained account of system theoretic aspects of multiagent networks and their wide ranging applications. This book has been adopted as a textbook at the following universities: University of Stuttgart, Germany; Royal Institute of Technology, Sweden; Johannes Kepler University, Austria; Georgia Tech, USA; University of Washington, USA; Ohio University, USA.

Flocking and Rendezvous in Distributed Robotics Bruce A. Francis, Manfredi Maggiore, 2015-10-24 This brief describes the coordinated control of groups of robots using only sensory input and no direct external commands. Furthermore, each robot employs the same local strategy, i.e., there are no leaders, and the text also deals with decentralized control allowing for cases in which no single robot can sense all the others. One can get intuition for the problem from the natural world; for example, flocking birds. How do they achieve and maintain their flying formation? Recognizing their importance as the most basic coordination tasks for mobile robot networks, the brief details flocking and rendezvous. They are shown to be physical illustrations of emergent behaviors with global consensus arising from local interactions. The authors extend the consideration of these fundamental ideas to describe their operation in flying robots and prompt readers to pursue further research in the field. *Flocking and Rendezvous in Distributed Robotics* will provide graduate students a firm grounding in the subject while also offering an authoritative reference work for more experienced workers seeking a brief but thorough treatment of an area that has rapidly gained in interest. *Control Subject to Computational and Communication Constraints* Sophie Tarbouriech, Antoine Girard, Laurentiu Hetel, 2018-06-01 This book provides a broad overview of the current problems, challenges, and solutions in the field of control theory, communication theory, and computational resources.

Submodularity in Dynamics and Control of Networked Systems Andrew Clark, Basel Alomair, Linda Bushnell, Radha Poovendran, 2015-12-21. This book presents a framework for the control of networked systems utilizing submodular optimization techniques. The main focus is on selecting input nodes for the control of networked systems, an inherently discrete optimization problem with applications in power system stability, social influence dynamics, and the control of vehicle formations. The first part of the book is devoted to background information on submodular functions, matroids, and submodular optimization, and presents algorithms for distributed submodular optimization that are scalable to large networked systems. In turn, the second part develops a unifying submodular optimization approach to controlling networked systems based on multiple performance and controllability criteria. Techniques are introduced for selecting input nodes to ensure smooth convergence, synchronization, and robustness to environmental and adversarial noise. Submodular optimization is the first unifying approach towards guaranteeing both performance and controllability with provable optimality bounds in static as well as time-varying networks. Throughout the text, the submodular framework is illustrated with the help of numerical examples and application-based case studies in biological energy and vehicular systems. The book effectively combines two areas of growing interest and will be especially useful for researchers in control theory, applied mathematics, networking, or machine learning with experience in submodular optimization but who are less familiar with the problems and tools available for networked systems, or vice versa. It will also benefit graduate students offering consistent terminology and notation that greatly reduces the initial effort associated with beginning a course of study in a new area.

Controllability, Identification, and Randomness in Distributed Systems Marzieh Nabi-Abdolyousefi, 2014-02-12. This interdisciplinary thesis involves the design and analysis of coordination algorithms on networks, identification of dynamic networks, and estimation on networks with random geometries, with implications for networks that support the operation of dynamic systems, e.g., formations of robotic vehicles, distributed estimation via sensor networks. The results have ramifications for fault detection and isolation of large-scale networked systems and optimization models and algorithms for next-generation aircraft power systems. The author finds novel applications of the methodology in energy systems such as residential and industrial smart energy management systems.

Hybrid and Networked Dynamical Systems Romain Postoyan, Paolo Frasca, Elena Panteley, Luca Zaccarian, 2024-03-20

Hybrid and Networked Dynamical Systems treats a class of systems that is ubiquitous in everyday life. From energy grids to fleets of robots or vehicles to social networks to biological networks, the same scenario arises: dynamical units interact locally through a connection graph to achieve a global task. The book shows how analysis and design tools can be adapted for control applications that combine the effects of network-induced interactions and hybrid dynamics with complex results. Following a scene-setting introduction, the remaining 12 chapters of the book are divided into three parts and provide a unique opportunity to describe the big picture that is the culmination of years of recent research activity. The contributing authors expand on their ideas at greater length than is possible in an archival research paper and use in-depth examples to illustrate their theoretical work. The widespread importance of hybrid and networked systems means that the book is of significant interest to academic researchers working in applied mathematics, control, and electrical, mechanical, and chemical engineering, and to their industrial counterparts.

Stability and Control of Large-Scale Dynamical Systems Wassim M.

Haddad, Sergey G. Nersisov, 2011-11-14. Modern complex large-scale dynamical systems exist in virtually every aspect of science and engineering and are associated with a wide variety of physical, technological, environmental, and social phenomena, including aerospace, power, communications, and network systems, to name just a few. This book develops a general stability analysis and control design framework for nonlinear large-scale interconnected dynamical systems and presents the most complete treatment on vector Lyapunov function methods, vector dissipativity theory, and decentralized control architectures. Large-scale dynamical systems are strongly interconnected and consist of interacting subsystems exchanging matter, energy, or information with the environment. The sheer size or dimensionality of these systems necessitates decentralized analysis and control system synthesis methods for their analysis and design. Written in a theorem-proof format with examples to illustrate new concepts, this book addresses continuous-time, discrete-time, and hybrid large-scale systems. It develops finite-time stability and finite-time decentralized stabilization, thermodynamic modeling, maximum entropy control, and energy-based decentralized control. This book will interest applied mathematicians, dynamical systems theorists, control theorists, and engineers and anyone seeking a fundamental and comprehensive understanding of large-scale interconnected dynamical systems and control.

Analysis and Control of Complex Dynamical Systems Kazuyuki

Aihara, Jun-ichi, Imura, Tetsushi, Ueta, 2015-03-20. This book is the first to report on theoretical breakthroughs on control of complex dynamical systems developed by collaborative researchers in the two fields of dynamical systems theory and control theory. As well, its basic point of view is of three kinds of complexity: bifurcation phenomena, subject to model uncertainty, complex behavior including periodic, quasi-periodic orbits, as well as chaotic orbits, and network complexity emerging from dynamical interactions between subsystems. *Analysis and Control of Complex Dynamical Systems* offers a valuable resource for mathematicians, physicists, and biophysicists, as well as for researchers in nonlinear science and control engineering, allowing them to develop a better fundamental understanding of the analysis and control synthesis of such complex systems.

Opinion Dynamics and the Evolution of Social Power in Social Networks Mengbin Ye, 2019-02-19 This book uses rigorous mathematical analysis to advance opinion dynamics models for social networks in three major directions First a novel model is proposed to capture how a discrepancy between an individual's private and expressed opinions can develop due to social pressures that arise in group situations or through extremists deliberately shaping public opinion Detailed theoretical analysis of the final opinion distribution is followed by use of the model to study Asch's seminal experiments on conformity and the phenomenon of pluralistic ignorance Second the DeGroot Friedkin model for evolution of an individual's social power self confidence is developed in a number of directions The key result establishes that an individual's initial social power is forgotten exponentially fast even when the network changes over time eventually an individual's social power depends only on the changing network structure Last a model for the simultaneous discussion of multiple logically interdependent topics is proposed To ensure that a consensus across the opinions of all individuals is achieved it turns out that the interpersonal interactions must be weaker than an individual's introspective cognitive process for establishing logical consistency among the topics Otherwise the individual may experience cognitive overload and the opinion system becomes unstable Conclusions of interest to control engineers social scientists and researchers from other relevant disciplines are discussed throughout the thesis with support from both social science and
