2nd IWA Leading-Edge on Water and Wastewater Treatment Technologies Mark C. M. van Loosdrecht, Jonathan Clement, 2005-04-30 Wastewater and drinking water treatment are essential elements of urban infrastructure In the course of the last century there has been enormous technical development so successful that for the general public in industrialized countries this infrastructure is hardly noticed Nevertheless there is ongoing activity to

further improve the existing processes The IWA Leading Edge Technology conference held in Prague helped to stimulate this development and this book helps disseminate the results A selection of presentations from the conference are included in this volume Wastewater and drinking water treatment are normally considered as two separate fields due to the very different boundary conditions that apply Nevertheless several issues such as membrane processes removal of micropollutants and water reuse are of crucial importance to both This potential for cross fertilization further enhances the value of this collection of high quality articles that delineate the leading edge of research and development in water and wastewater treatment

Decentralized Water Reclamation Engineering Robert L. Siegrist, 2016-10-26 This book presents technical information and materials concerning the engineering of decentralized infrastructure to achieve effective wastewater treatment while also minimizing resource consumption and providing a source of reclaimed water nutrients and organic matter The approaches technologies and systems described are targeted for green building and sustainable infrastructure across the United States and similar industrialized nations but they are also applicable to water and sanitation projects in developing regions around the world Today decentralized infrastructure can be used to sustainably serve houses buildings and developments with water use and wastewater flows of 100 to 100 000 gal d or more The book provides in depth engineering coverage of the subject in a narrative and slide format specifically designed for classroom lectures or facilitated self study Key topics are covered including engineering to satisfy project goals and requirements including sustainability contemporary water use and wastewater generation and methods to achieve water use efficiency and source separation alternative methods of wastewater collection and conveyance and treatment and reuse operations including tank based e g septic tanks aerobic treatment units porous media biofilters membrane bioreactors wetland based e g free water surface and vegetated subsurface bed wetlands and land based unit operations e g subsurface soil infiltration shallow drip dispersal Approaches and technologies are also presented that can achieve nutrient reduction and resource recovery in some cases or pathogen destruction to enable a particular discharge or reuse plan The book also describes requirements and methods for effective management of the process solids sludges and residuals that can be generated by various approaches technologies and systems The book contains over 300 figures and illustrations of technologies and systems and over 150 tables of design and performance data There are also more than 200 questions and problems relevant to the topics covered including example problems that have solutions presented to illustrate engineering concepts and calculations

Industrial Waste Treatment Handbook Frank Woodard, 2001-09-11 All industries produce waste products that unless treated or mitigated in some way will be harmful to the human or natural environment These waste products will generally need to be identified according to the industrial process in question neutralized or rendered less harmful and finally disposed of into the surrounding land air or watercourses It is therefore of vital importance to every environmental pollution or plant manager or engineer that these processes be fully understood and implemented or the cost to either the company or the environment can

be catastrophic With increasing government regulation of pollution as well as willingness to levy punitive fines for transgressions and the ever present financial imperative to carry out these activities in the most efficient and cost effective manner it is the responsibility of the professionals in question to ensure that they have the most up to date information available at their disposal This book provides not only that but the only available methodology for identifying which waste types are produced from which industrial processes and how they can be treated This unique feature makes this book one that every environmental industrial and plant manager engineer and consultant will want to have on their bookshelf Essential aspect of and requirement for all manufacturing industry The only up to date book on this subject area available Takes a practical applications standpoint not a theoretical approach
