Handbooks in Operations Research and Management Science: Simulation Shane G. Henderson, Barry L.

Nelson, 2006-09-02 This Handbook is a collection of chapters on key issues in the design and analysis of computer simulation experiments on models of stochastic systems. The chapters are tightly focused and written by experts in each area. For the purpose of this volume, simulation refers to the analysis of stochastic processes through the generation of sample paths, realization of the processes. Attention focuses on design and analysis issues and the goal of this volume is to survey the concepts, principles, tools, and techniques that underlie the theory and practice of stochastic simulation design and analysis. Emphasis is placed on the ideas and methods that are likely to remain an intrinsic part of the foundation of the field for the foreseeable future. The chapters provide up-to-date references for both the simulation researcher and the advanced simulation user, but they do not constitute an introductory level. How to guide Computer scientists, financial analysts, industrial engineers, management scientists, operations researchers, and many other professionals use stochastic simulation to design, understand, and improve communications, financial, manufacturing, logistics, and service systems. A theme that runs throughout these diverse applications is the need to evaluate system performance in the face of uncertainty, including uncertainty in user load, interest rates, demand for product availability, of goods, cost of transportation, and equipment failures. Tightly focused chapters written by experts. Surveys concepts, principles, tools, and techniques that underlie the theory and practice of stochastic simulation design and analysis. Provides an up-to-date reference for both simulation researchers and advanced simulation users.

Production Planning with Capacitated Resources and Congestion Hubert Missbauer, Reha Uzsoy, 2020-02-26 This book presents a comprehensive overview of recent developments in production planning The monograph begins with an

introductory chapter reviewing the need for these production planning models that operate by determining time phased releases of work into the facility or supply chain relating these to the Manufacturing Planning and Control MPC and Advanced Planning and Scheduling APS frameworks that form the basis of most academic research and industrial practice The extensive body of work on Workload Control is also placed in this context and proves the need for improved models with a discussion of the difficulties these approaches encounter The next two chapters present a detailed review of the state of the art in optimization models based on exogenous planned lead times and examines the cases where these can take both integer and fractional values The difficulties arising in estimating planned lead times are consistent with factory behavior which are highlighted noting that many of these lead to non convex optimization models Attempts to address these difficulties by iterative multimodel approaches that combine simulation and mathematical programming are also discussed in detail The next three chapters of the volume address the set of techniques developed using clearing functions which represent the expected output of a resource in a planning period as a function of the expected workload of the resource during that period The chapters on this subject propose a basic optimization model for multiple products discuss the difficulties of this model and some possible solutions It also reviews prior work and discuss a number of alternative formulations of the clearing function concept with their respective advantages and disadvantages Applications to lot sizing decisions and a number of other specific problems are also described This volume concludes with an assessment of the state of the art described in the volume and several directions for future work

Ritzman,M. Tvrđý,2013-03-09 This volume is intended to expand the dialogue and interest among both practitioners and academicians in a problem area worthy of attention by all The concept of disaggregation admits to our current inability to solve many types of interrelated hierarchical problems simultaneously It offers instead a sequential iterative process as a workable and necessary procedure The papers in this volume are selected from those presented at a Disaggregation Conference held in March 1977 at The Ohio State University We heartily applaud all those who participated in the conference and particularly appreciate the cooperation of those authors whose work is published in this collection Part A contains four papers which define the various dimensions of

disaggregation The paper by Martin Starr which was the text of his luncheon address at the conference provides several interesting perspectives to the problem Although disaggregation suggests tearing apart as Professor Starr illustrates with his butterfly example it also suggests a putting together or a synthesis which recognizes interrelationships and dependencies The next paper by Lee Kra jewski and Larry Ritzman offers a general model of disaggregation for both the manufacturing and service sectors After reading the papers in this section as well as the papers in subsequent sections you will identify other dimensions to hierarchical decision making which go beyond this generalized model

Optimization and Learning via Stochastic Gradient Search Felisa Vázquez-Abad, Bernd Heidergott, 2025-10-14 An introduction to gradient based stochastic optimization that integrates theory and implementation This book explains gradient based stochastic optimization exploiting the methodologies of stochastic approximation and gradient estimation Although the approach is theoretical the book emphasizes developing algorithms that implement the methods The underlying philosophy of this book is that when solving real problems mathematical theory the art of modeling and numerical algorithms complement each other with no one outlook dominating the others The book first covers the theory of stochastic approximation including advanced models and state of the art analysis methodology treating applications that do not require the use of gradient estimation It then presents gradient estimation developing a modern approach that incorporates cutting edge numerical algorithms Finally the book culminates in a rich set of case studies that integrate the concepts previously discussed into fully worked models The use of stochastic approximation in statistics and machine learning is discussed and in depth theoretical treatments for selected gradient estimation approaches are included Numerous examples show how the methods are applied concretely and end of chapter exercises enable readers to consolidate their knowledge Many chapters end with a section on Practical Considerations that addresses typical tradeoffs encountered in implementation The book provides the first unified treatment of the topic written for a wide audience that includes researchers and graduate students in applied mathematics engineering computer science physics and economics

Location, Transport and Land-Use Yupo Chan, 2004-10-11 1 Theme and focus Few books are available to integrate the models for facilities siting transportation and land use Employing state of the art quantitative models and case studies this book would guide the siting of such facilities as transportation terminals warehouses nuclear power plants military bases landfills emergency shelters state parks and industrial plants The book also shows the use of statistical tools for forecasting and analyzing implications of land use decisions The idea is that land use on a map is necessarily a consequence of individual and often conflicting siting decisions over time Since facilities often develop to form a community these decisions are interrelated spatially i.e. they need to be accessible to one another via the transportation system It is our thesis that a common methodological procedure exists to analyze all these spatial temporal constructs While there are several monographs and texts on subjects related to this book's this volume is unique in that it integrates existing practical and theoretical works on facility location transportation and land use Instead of dealing with individual facility location

transportation or the resulting land use pattern individually it provides the underlying principles that are behind these types of models Particularly of interest is the emphasis on counter intuitive decisions that often escape our minds unless deliberate steps of analysis are taken Oriented toward the fundamental principles of infrastructure management the book transcends the traditional engineering and planning disciplines where the main concerns are often exclusively either physical design fiscal socioeconomic or political considerations *Advances in Manufacturing Technology XXXIII* Mark Price, 2019-08-15

The development and management of technologies and operations are key to the success of all types of manufacturing business This book presents the proceedings of the 17th International Conference on Manufacturing Research ICMR 2019 held in Belfast UK on 10-12 September 2019 ICMR has been the UK's main manufacturing research conference for 34 years and an international conference since 2003 It brings together researchers academics and industrialists to share their vision knowledge and experience and discuss emerging trends and new challenges in manufacturing research The conference theme of ICMR2019 was smart manufacturing and the book includes the 82 papers presented at the conference representing an acceptance rate of 69% These have been divided into 13 parts which cover topics ranging from robot automation and machining processes additive manufacturing composite manufacturing design methods to information management quality control production optimization and product lifecycle management Providing an overview of current trends and developments the book will be of interest to researchers and engineers in the relevant area of manufacturing processes design and production management
