Intracellular biomineralization in bacteria Damien Faivre, 2014-11-14 Bacteria can sequester metals and other ions intracellularly in various forms ranging from poorly ordered deposits to well ordered mineral crystals Magnetotactic bacteria provide one example of such intracellular deposits They synthesize intracellular magnetic minerals of magnetite Fe_3O_4 and or greigite Fe_3S_4 magnetosomes which are generally less than 150 nm and organized into one or multiple chain structures

The magnetosome chain s act like a compass needle to facilitate the navigation of magnetotactic bacteria by using the Earth s magnetic field Due to their ubiquitous distribution in aquatic and sedimentary environments magnetotactic bacteria play important roles in global iron cycling Other intracellular mineral phases have been evidenced in bacteria such as As_2S_3 CaCO_3 CdS Se_0 or various metal phosphates which may play as well a significant role in the geochemical cycle of these elements However in contrast to magnetotactic bacteria the biological and environmental function of these particles remains a matter of debate In recent years such intracellularly biomineralizing bacteria have become an attractive model system for investigating the molecular mechanisms of organelle like structure formation in prokaryotic cells The geological significance of intracellular biomineralization is important spectacular examples are fossil magnetosomes that may significantly contribute to the bulk magnetization of sediments and act as potential archives of paleoenvironmental changes In addition intracellular mineral deposits formed by bacteria have potentially versatile applications in biotechnological and biomedical fields After more than four decades of research the knowledge on intracellularly biomineralizing bacteria has greatly improved The aim of this Research Topic is to highlight recent advances in our understanding of intracellular biomineralization by bacteria Magnetotactic bacteria are a system of choice for that topic but other intracellularly biomineralizing bacteria may bring a unique perspective on that process Research papers reviews perspectives and opinion papers on i the diversity and ecology of intracellularly biomineralizing bacteria ii the molecular mechanisms of intracellular biomineralization iii the chemo and magneto taxis behaviors of magnetotactic bacteria iv the involvement of intracellularly biomineralizing bacteria in local or global biogeochemical cycling v the paleoenvironmental reconstructions and paleomagnetic signals based on fossil magnetosomes vi and the applications of intracellular minerals in biomaterial and biotechnology were welcomed

Microbial Megaplastids Edward Schwartz, 2009-01-29 Megaplastids are extrachromosomal genetic elements in the size range of 100 kb and larger They are found in physiologically and phylogenetically diverse groups of bacteria and archaea By definition megaplastids are not essential for the viability of their hosts under all growth conditions but paradoxically many megaplastids carry the genetic information for the defining and characteristic traits of the organism in which they reside *Microbial Megaplastids* reviews our knowledge of the extensively studied representatives such as the catabolic plasmids of the pseudomonads the rhizobial *Sym* plasmids the *Ti* plasmids of the genus *Agrobacterium* and the giant enterobacterial virulence plasmids It also presents snapshots of more recently discovered megaplastids The contribution of megaplastids to the biology of their hosts is described highlighting the interactions between megaplastid and chromosomal genes

Bacterial Organelles and Organelle-like Inclusions Dieter Jendrossek, 2021-01-04 The new series *Microbiology Monographs* begins with two volumes on intracellular components in prokaryotes In this first volume *Inclusions in Prokaryotes* the components labeled inclusions are defined as discrete bodies resulting from synthesis of a metabolic product Research on the biosynthesis and reutilization of the

accumulated materials is still in progress and interest in the inclusions is growing This comprehensive volume provides historical background and comprehensive reviews of eight well known prokaryotic inclusions **Inclusions in Prokaryotes** Jessup M. Shively, 2006-05-04 The new series Microbiology Monographs begins with two volumes on intracellular components in prokaryotes In this first volume Inclusions in Prokaryotes the components labeled inclusions are defined as discrete bodies resulting from synthesis of a metabolic product Research on the biosynthesis and reutilization of the accumulated materials is still in progress and interest in the inclusions is growing This comprehensive volume provides historical background and comprehensive reviews of eight well known prokaryotic inclusions **Microbial Metal Respiration** Johannes Gescher, Andreas Kappler, 2014-02-21 Microbes can respire on metals This seemingly simple finding is one of the major discoveries that were made in the field of microbiology in the last few decades The importance of this observation is evident Metals are highly abundant on our planet Iron is even the most abundant element on Earth and the fourth most abundant element in the Earth's crust Hence in some environments iron but also other metals or metalloids are the dominant respiratory electron acceptors Their reduction massively drives the carbon cycle in these environments and establishes redox cycles of the metallic electron acceptors themselves These redox cycles are not only a driving force for other biotic reactions but are furthermore necessary for initiating a number of geochemically relevant abiotic redox conversions Although widespread and ecologically influential electron transfer onto metals like ferric iron or manganese is biochemically challenging The challenge is to transfer respiratory electrons onto metals that occur in nature at neutral pH in the form of metal oxides or oxihydroxides that are effectively insoluble Obviously it is necessary that the microbes specially adapt in order to catalyze the electron transfer onto insoluble electron acceptors The elucidation of these adaptations is an exciting ongoing process To sum it up dissimilatory metal reduction has wide spread implications in the field of microbiology biochemistry and geochemistry and its discovery was one of the major reasons to establish a novel scientific field called geomicrobiology Recently the discovery of potential applications of dissimilatory metal reducers in bioremediation or current production in a microbial fuel cell further increased the interest in studying microbial metal reduction **Plant Growth and Health Promoting Bacteria** Dinesh K. Maheshwari, 2010-09-28 To cope with the increasing problems created by agrochemicals such as plant fertilizers pesticides and other plant protection agents biological alternatives have been developed over the past years These include biopesticides such as bacteria for the control of plant diseases and biofertilizer to improve crop productivity and quality Especially plant growth promoting rhizobacteria PGPR are as effective as pure chemicals in terms of plant growth enhancement and disease control in addition to their ability to manage abiotic and other stresses in plants The various facets of these groups of bacteria are treated in this Microbiology Monograph with emphasis on their emergence in agriculture Further topics are Bacillus species that excrete peptides and lipopeptides with antifungal antibacterial and surfactant activity plant bacteria environment interactions mineral nutrient exchange nitrogen assimilation

biofilm formation and cold tolerant microorganisms

Laccases in Bioremediation and Waste Valorisation Dietmar Schlosser, 2020-08-31 This Microbiology Monographs volume covers the latest advances in laccase applications in bioremediation and waste valorisation The first three chapters provide a comprehensive introduction to fungal and bacterial laccases the two most important enzyme groups from an application viewpoint and their practical use in bioremediation and lignocellulosic waste valorisation Subsequent chapters discuss possible combinations of laccases and further potentially collaborating enzymes and offer in depth insights into laccase immobilisation for wastewater treatment and environmental biosensor applications of laccases Lastly the book addresses the quest for enzymes with improved and better fitting properties covering laccase engineering by directed and computational evolution and novel enzymes from extreme environments As such it is a fascinating read for microbiologists in both industry and academia

Molecular Microbiology of Heavy Metals Dietrich H. Nies, Simon Silver, 2007-03-24 All forms of life depend on a variety of heavy metal ions Nearly one third of all gene products require a metal ion for proper folding or function However even metals generally regarded as non poisonous are toxic at higher concentrations including the essential ones Thus sensitive regulation of metal uptake storage allocation and detoxification is needed to maintain cellular homeostasis of heavy metal ions Molecular Microbiology of Heavy Metals includes chapters on allocation of metals in cells metal transporter storage and metalloregulatory proteins cellular responses to metal ion stress transcription of genes involved in metal ion homeostasis uptake of essential metals metal efflux and other detoxification mechanisms Also discussed are metal bioreporters for the nanomolar range of concentration and tools to address the metallome Chapters in the second part cover specific metals such as Fe Mn Cu Ni Co Zn and Mo as key nutrient elements and Ag As Cd Hg and Cr as toxic elements

Microbial Production of High-Value Products Bernd H. A. Rehm, David Wibowo, 2022-09-06 This edited volume emphasizes how microorganisms have become a reliable pillar of biotechnology The authors discuss advances in synthetic biology and genetic engineering that have made it possible to reprogram the microbial cellular capabilities This enables an economically viable production of high value products at an industrial level The first part of the book provides an overview of synthetic biology and genome editing tools for engineering microbial cell factories in modern fermentation Readers also learn how high throughput bioprocessing methods are used to recover and purify microbial products The remaining parts of this book explore the implementation and challenges of these upstream and downstream processing techniques for manufacturing high value products Cost effectiveness and quality control are key factors when discussing the production of low molecular weight products biopharmaceuticals biopolymers and protein based nanoparticles This book is a valuable resource for biotechnologists both in the industry and in academia
