Performance of DFIG and PMSG Wind Turbines Kenneth Okedu,2023-04-05 Due to environmental pollution and climate change the use of renewable energy sources as an alternative means of power generation is on the rise globally This is because of their clean nature which makes them ecofriendly with little or no pollution compared to the traditional fossil fuel power generation power plants

Among the various renewable energy sources wind energy is one of the most widely employed due to its promising technology Wind turbine technologies could be classified into two groups as follows Fixed Speed Wind Turbines FSWTs and Variable Speed Wind Turbines VSWTs There have been tremendous improvements in wind turbine technology over the years from FSWTs to VSWTs as a result of fast innovations and advanced developments in power electronics Thus the VSWTs have better wind energy capture and conversion efficiencies less acoustic noise and mechanical stress and better power quality in power grids without support from external reactive power compensators due to the stochastic nature of wind energy The two most widely employed VSWTs in wind farm development are the Doubly Fed Induction Generator DFIG and the Permanent Magnet Synchronous Generator PMSG wind turbines In order to solve transient stability intricacies during power grid faults this book proposes different control strategies for the DFIG and PMSG wind turbines
