Microbial electrochemical systems MESs also known as bioelectrochemical systems BESs are promising technologies for energy and products recovery coupled with wastewater treatment and have attracted increasing attention Many studies have been conducted to expand the application of MESs for contaminants degradation and bioremediation and increase the efficiency of electricity production by optimizing architectural structure of MESs developing new electrode materials etc However one of the big challenges for researchers to overcome before MESs can be used commercially is to improve the performance of the biofilm on electrodes so that electron transfer can be enhanced This would lead to greater production of electricity energy or other products Electrochemically active microorganisms EAMs are a group of microorganisms which are able to release electrons from inside their cells to an electrode or accept electrons from an electron donor The way in which EAMs do this is called extracellular electron transfer EET So far two EET mechanisms have been identified direct electron transfer from microorganisms physically attached to an electrode and indirect electron transfer from microorganisms that are not physically attached to an electrode 1 Direct electron transfer between microorganisms and electrode can occur in two ways a when there is physical contact between outer membrane structures of the microbial cell and the surface of the electrode b when electrons are transferred between the microorganism and the electrode through tiny projections called pili or nanowires that extend from the outer membrane of the microorganism and attach themselves to the electrode 2 Indirect transfer of electrons from the microorganisms to an electrode occurs via long range electron shuttle compounds that may be naturally present in wastewater for example or may be produced by the microorganisms themselves The electrochemically active biofilm which degrades contaminants and produces electricity in MESs consists of diverse community of EAMs and other microorganisms However up to date only a few EAMs have been identified and most studies on EET have focused on the two model species of *Shewanella oneidensis* and *Geobacter sulfurreducens* *Advances in Probiotic Delivery Systems* Tanmay Sarkar, Ayan Chatterjee, Anirudha Dutta, 2025-07-01 *Advances in Probiotic Delivery Systems* Strategies for Enhanced Viability Targeted Delivery and Efficacy covers the complex world of probiotics offering a comprehensive exploration of innovative delivery mechanisms designed to overcome challenges of stability and efficacy From oral administration to alternative delivery routes each chapter provides insights into cutting edge formulation strategies encapsulation techniques

and emerging technologies equipping readers with the knowledge to explore the full potential of probiotics for health and wellness Bridging the gap between theory and practice in probiotic delivery systems this book delivers insights into the most effective delivery strategies Despite the growing interest in probiotics and their potential health benefits challenges such as poor stability and limited efficacy hinder their widespread application This book fills this critical gap by providing readers with a thorough understanding of the underlying principles latest advancements and practical solutions in probiotic delivery By consolidating the expertise of leading researchers and practitioners the book empowers professionals across various industries to develop and implement effective probiotic formulations that make a difference in health outcomes Explores cutting edge formulation strategies and encapsulation techniques for enhanced probiotic stability and efficacy Provides practical solutions for oral and alternative probiotic delivery routes Empowers professionals to develop effective probiotic formulations for improved health outcomes Bridges the gap between theoretical principles and practical applications in probiotic delivery
