

EXPERIMENT 5

Determination of Acid Content in Vinegars by Titration with Sodium Hydroxide

Vinegar is a common household ingredient that is used particularly in cooking and sometimes in cleaning. It is formed by aerobic bacteria oxidizing grain alcohol to acetic acid (CH_3COOH), which is the primary ingredient for vinegars, and water. According to the specified rule of law, a vinegar can only be sold at the market if the solution contains at least 5% w/v of acetic acid. In this experiment, acid-base titration will be used to measure the total acid concentration in different varieties of vinegar, and the determination if the vinegar meets the minimum acetic acid concentration will be done. The percent acetic acid will also be calculated to test the authenticity of the total acidity based on the vinegar's label.

CHEMICALS/MATERIALS/EQUIPMENT:

Same set with experiment 4, except that the unknown sample must be contained in vials with fitted snug covers instead of weighing bottles.

PROCEDURE:

Same set of procedures (Parts A and B) with experiment 4.

C. Analysis of unknown sample

Note: For this experiment, the unknown vinegar sample must be stored in individual vials with snug covers.

1. Pipet 10.00-mL aliquot of the unknown vinegar sample into a 250-mL Erlenmeyer flask.
2. Add about 50 mL of distilled water and 2 drops of phenolphthalein indicator to each vessel. You may increase the amount of indicator as necessary to make the color changes visible in turbid samples.
3. Titrate with the standardized NaOH titrant until the phenolphthalein endpoint is reached and report the acidity of the vinegar as % (w/v) CH_3COOH . Compute also for the mean, SD, and % RSD for the triplicate measurements.

Unknown: Datu Puti, 4.5% acidity, good results

DATA AND RESULTS

Note: You may devise your own on your logbook. Make sure that it presents your data in a CLEAN, LEGIBLE, COMPLETE, and TRUTHFUL manner.
