The Lesson of the Kaibab

Introduction: The environment may be altered by forces within the biotic community, as well as by relationships between organisms and the physical environment. The **carrying capacity** of an ecosystem is the maximum number of organisms that an area can support on a sustained basis. The density of a population may produce such profound changes in the environment that the environment becomes unsuitable for the survival of that species. For instance, overgrazing of land may make the land unable to support the grazing of animals that lived there.

Objectives

- Graph data on the Kaibab deer population of Arizona from 1905 to 1924
- Determine factors responsible for the changing populations
- Determine the carrying capacity of the Kaibab Plateau

Background

Before 1905, the deer on the Kaibab Plateau were estimated to number about 4000. The average carrying capacity of the range was then estimated to be about 30,000 deer. On November 26th, 1906, President Theodore Roosevelt created the Grand Canyon National Game Preserve to protect the "finest deer herd in America."

Unfortunately, by this time the Kaibab forest area had already been overgrazed by sheep, cattle, and horses. Most of the tall grasses had been eliminated. The first step to protect the deer was to ban all hunting. In addition, in 1907, The Forest Service tried to exterminate the predators of the deer. Between 1907 and 1924, 806 mountain lions, 20 wolves, 7300 coyotes and more than 500 bobcats were killed.

Signs that the deer population was out of control began to appear as early as 1910 - the range was beginning to deteriorate rapidly. The Forest Service reduced the number of livestock grazing permits. By 1923, the deer were reported to be on the verge of starvation and the range conditions were described as "deplorable."

The Kaibab Deer Investigating Committee recommended that all livestock not owned by local residents be removed immediately from the range and that the number of deer be cut in half as quickly as possible. Hunting was reopened, and during the fall of 1924, 575 deer were killed by hunters. However, these deer represented only one-tenth the number of deer that had been born that spring. Over the next two winters, it is estimated that 40,000 deer starved to death.

Today, the Arizona Game Commission carefully manages the Kaibab area with regulations geared to specific local needs. Hunting permits are issued to keep the deer in balance with their range. Predators are protected to help keep herds in balance with food supplies. Thigh winter losses can be checked by keeping the number of deer near the carrying capacity of the range.

In the Absence of Predators Christian C. Young, 2002-01-01 The wildlife management controversy over the deer on the Kaibab Plateau north of the Grand Canyon remains one of the best known examples of nature's balance being upset by human efforts to protect a certain aspect of nature The controversy involves an apparent deer population explosion and crash on the Kaibab Plateau in the 1920s which was initially blamed on the removal of natural predators In the first comprehensive account of the Kaibab deer controversy Christian C Young describes the interactions rivalries and conflicts between state and federal agencies scientists nature lovers conservationists and hunters Young blends a contextualized history of events with a new and more useful understanding about the promise of scientific knowledge in the face of factual uncertainty and public controversy Scientists and historians have used this case to illustrate the difficulties of controlling wild populations Their message is typically one of failure and the reason most often given centers on our lack of knowledge of the natural world As such the burden of failure seems to rest on scientists who work diligently but always seem to offer too little too late in the way of practical advice Since our knowledge of the natural world will always be incomplete Young argues that our ability to investigate nature requires flexible and interactive management plans He shows how earlier truths learned on the Kaibab came to be recognized as myths and offers a compelling lesson about how science and society interact within challenging contexts of disagreement
