Patil,Dr. Shailesh Shivram Dongare,Dr. Vimal Sagar,Mrs. Anita Sagar,2022-09-15 Electrical connections are made through a variety of terminals or leads on electronic components These leads build an electronic circuit by connecting to other electrical components most of the time through wire so that the circuit may perform a certain purpose for example an amplifier radio receiver or oscillator Electronic components can be packaged either discretely as arrays or networks of similar components or integrated inside of packages such as hybrid integrated circuits semiconductor integrated circuits or thick film devices Discrete packaging is the most common form of packaging for electronic components Components may be categorized as passive active or electromechanical depending on their level of involvement According to the conventional interpretation of the term passive components are those that are incapable of generating their own source of energy while an active component such as a battery is one that really performs the function of generating energy on its own The essential electrical components are divided in each chapter in this book so that you may have a better understanding of them When you start working with electrical systems you may go back to this basic introduction for assistance Beginning with capacitors and resistors then going to utilise integrated circuits and finally installing batteries and motors would be a clear strategy to follow This strategy is adaptable to a wide variety of difficult and sophisticated tasks In order for the readers to have a better understanding of the book it is essential that they read each and every chapter in great depth The engineering students would find this book to be extremely helpful in their studies *The Navy Electricity and Electronics Training Series Module*
