Lung Inflammation in Health and Disease, Volume II Yong-Xiao Wang,2021-05-21 Lung diseases are leading causes of death and disability globally with about 65 million people suffering from COPD and 334 million from asthma Each year tens of millions of people develop and can die from lung infections such as pneumonia and TB Systemic inflammation may induce and exacerbate local inflammatory diseases in the lungs and local inflammation can in turn cause systemic inflammation There is increasing evidence of the coexistence of systemic and local inflammation in patients suffering from asthma COPD and other lung diseases and the co morbidity of two or more local inflammatory diseases often occurs For example rheumatoid arthritis frequently occurs together with and promotes the development of pulmonary hypertension This co morbidity significantly impacts quality of life and can result in death for some patients Current treatment options for lung disease are neither always effective nor condition specific there is a desperate need for novel therapeutics in the field Additionally the molecular and physiological significance of most major lung diseases is not well understood which further impedes development of new treatments especially in the case of coexistent lung diseases with other inflammatory diseases Great progress has been made in recent years in many areas of the field particularly in understanding the molecular geneses regulatory mechanisms signalling pathways and cellular processes within lung disease as well as basic and clinical technology drug discovery diagnoses treatment options and predictive prognoses This is the first text to aggregate these developments In two comprehensive volumes experts from all over the world present state of the art advances in the study of lung inflammation in health and disease Contributing authors cover well known as well as emerging topics in basic translational and clinical research with the aim of providing researchers clinicians professionals and students with new perspectives and concepts The editors hope these books will also help to direct future research in lung disease and other inflammatory diseases and result in the development of novel therapeutics

NK Cell Subsets in Health and Disease: New Developments Emanuela Marcenaro, Luigi D. Notarangelo, Jordan S. Orange, Eric Vivier, 2017-11-29 Natural Killer NK cells were discovered ca 1975 as the first group of lymphoid cells that were neither T cells nor B cells Since then the dissection of the biology of NK cells has been growing exponentially with many seminal discoveries from the identification of MHC class I specific inhibitory receptors to the discovery of receptor ligand pairs involved in NK cell activation and to the manipulation of NK cells in cancer In this research topic we asked a group of thought leaders in NK cell biology to review recent advances in their origins and biology and their

roles in cancer infection and inflammation Together these 25 articles provide a timely survey of NK cells as critical immunologic components of health and disease They will hopefully prompt further dialogue and developments in basic and translational immunology

Recent Advances in Oral Immunity Avi-Hai Hovav, Asaf Wilensky, Jean-Pierre Allam, 2021-08-03 The oral mucosa is a challenging environment from an immunological perspective containing discrete niches with a unique architecture and function that requires precise adjustment of the immune system Being the port of entry to the gastrointestinal and respiratory tracts the oral cavity is also constantly challenged by antigens derived from air and food Moreover the oral cavity is the sole tissue of the body harboring a hard surface i e the tooth that is exposed to the hostile external environment resulting in the formation of a complex biofilm that has local and systemic effects To deal with such

challenges the oral immune system aims to prevent the invasion of pathogens harmful antigens and to tolerate non pathogenic counterparts in order to maintain homeostasis In recent years numerous studies have addressed these fundamental issues revealing sophisticated mechanisms engaged by the immune system to maintain oral mucosal homeostasis and to combat various immunological insults Some of these studies have identified novel immunological mechanisms emphasizing the uniqueness of the oral immune system and the necessity to further investigate its functions

Tamburini,Amanda W. Lund,Timothy P. Padera,2020-01-22 **Community Series in Trends in Neuroimmunology: cross-talk between brain-resident and peripheral immune cells in both health and disease, volume II** Estela Maris Muñoz,Rajnikant Mishra,Veronica Martinez Cerdeño ,Shashank Kumar Maurya,Janina Edith Borgonovo,Suryanarayan Biswal ,Carlos Leandro Freitas,2025-08-21 The functional anatomy of organisms is maintained by the coordination of different systems that often rely on particular interactions between specialized cells and between macromolecules The immune system works with the circulatory and the lymphatic systems to protect most of the organs However some organs are considered immune privileged due to the presence of highly selective and regulated barriers such as the blood brain barrier BBB within the brain The BBB controls periphery brain molecule exchange and prevents immune effector cells from entering the homeostatic brain BBB associated elements such as endothelial cells pericytes astrocytes and microglia potentially can function as antigen presenting cells APC Pathological scenarios that induce dysfunction of the BBB and its associated cells may lead to the infiltration of lymphocytes crossing over from the blood to brain Similarly traumas can also enable B and T lymphocytes to pass bidirectionally between the CNS and the periphery via the meningeal lymphatic vessels which drain into the cervical lymph nodes Research in animals and in humans has revealed that B and T cells are involved in the progression of neurological diseases It has been showed that under particular conditions T cells establish themselves and become resident in the brain TRM cells from where they can either exert beneficial or detrimental effects on brain function Amazing

efforts have been made to further comprehend interactions between brain specific cells and peripheral immune cells and especially their roles and impact on the onset progression and eventual resolution of diverse brain pathologies

Pathogenic Advances and Therapeutic Perspectives for Eosinophilic Inflammation Florence E. Roufousse,Mats W. Johansson,2018-12-06 With the recent approval of the first eosinophil depleting therapeutic agents targeting the IL 5 pathway for treatment of severe eosinophilic asthma eosinophils and eosinophilic disorders are in the limelight Indeed setbacks during clinical development of these compounds have revealed how much remains to be known about eosinophil biology in vivo and have nurtured profuse research both on basic eosinophil biology and on pathogenic disease mechanisms in order to better delineate the most meaningful targets for innovative therapeutic strategies On one hand variable degrees of eosinophil depletion observed in some compartments during IL 5 targeted treatment indicate that certain eosinophil subsets may not rely on this cytokine and or that other important pro eosinophilic mediators and signaling pathways are operative in vivo On the other hand it is increasingly clear that disorders involving eosinophils such as asthma are the final outcome of complex interactions between diverse cell types and mediators beyond eosinophils and IL 5 These include type 2 helper T Th2 cells and innate lymphoid cells mast cells and a variety of factors that either activate eosinophils or are released by them Although a considerable amount of research has focused on asthma because it is a common condition and because management of severe asthma remains a major challenge several rare eosinophilic disorders with more homogenous features have proven to be extremely useful models to reach a better understanding of the involvement of eosinophils in tissue damage and dysfunction and of the micro environmental interactions operating within the complex network of eosinophilic inflammation Unraveling this interplay has resulted in advances in the development of molecular tools to detect disease subsets and to monitor therapeutic responses and in identification of promising new therapeutic targets This Research Topic dedicated to eosinophilic conditions covers aspects of the biology of eosinophils and closely related cells of particular relevance for drug development reports on translational research investigating pathogenic mechanisms of specific eosinophilic disorders in humans that will likely result

in significant changes in the way patients are managed and presents an overview of the current advancement of targeted drug development for these conditions with a special focus on asthma
