Multiscale Modeling and Simulation of Composite Materials and Structures Young Kwon, David H. Allen, Ramesh R. Talreja, 2007-12-04 This book presents the state of the art in multiscale modeling and simulation techniques for composite materials and structures It focuses on the structural and functional properties of engineering composites and the sustainable high performance of components and structures The multiscale techniques can be also applied to nanocomposites which are important application areas in nanotechnology There are few books available on this topic Bäcklund and Darboux Transformations C. Rogers, W. K. Schief, 2002-06-24 This book explores the deep and fascinating connections that exist between a ubiquitous class of physically important waves known as solitons and the theory of transformations of a privileged class of surfaces as they were studied by eminent geometers of the nineteenth century Thus nonlinear equations governing soliton propagation and also mathematical descriptions of their remarkable interaction properties are shown to arise naturally out of the classical differential geometry of surfaces and what are termed Bäcklund Darboux transformations This text the first of its kind is written in a straightforward manner and is punctuated by exercises to test the understanding of the reader It is suitable for use in higher undergraduate or graduate level courses directed at applied mathematicians or mathematical physics **Mathematics in Victorian Britain** Raymond Flood, Adrian Rice, Robin Wilson, 2011-09-29 With a foreword by Adam Hart Davis this book constitutes perhaps the first general survey of the mathematics of the Victorian period It charts the institutional development of mathematics as a profession as well as exploring the numerous innovations made during this time many of which are still familiar today An Introduction to Parallel and Vector Scientific Computation Ronald W. Shonkwiler, Lew Lefton, 2006-08-14 In this text students of applied mathematics science and engineering are introduced to fundamental ways of thinking about the broad context of parallelism The authors begin by giving the reader a deeper understanding of the issues through a general examination of timing data dependencies and communication These ideas are implemented with respect to shared memory parallel and vector processing and distributed memory cluster computing Threads OpenMP and MPI are covered along with code examples in Fortran C and Java The principles of parallel computation are applied throughout as the authors cover traditional topics in a first course in scientific computing Building on the fundamentals of floating point representation and numerical error a thorough treatment of numerical linear algebra and eigenvector eigenvalue problems is provided By studying how these algorithms parallelize the reader is able to explore parallelism inherent in other computations such as Monte Carlo methods
