Kokhanovsky, 2014-09-22 Light Scattering Reviews vol 9 is aimed at the description of modern advances in radiative transfer and light scattering The following topics will be considered light scattering by atmospheric dust particles and also by inhomogeneous scatterers the general purpose discrete ordinate algorithm DISORT for radiative transfer the radiative transfer code RAY based on the adding doubling solution of the radiative transfer equation aerosol and cloud remote sensing use of polarization in remote sensing direct aerosol radiative forcing principles of the Mueller matrix measurements light reflectance from various land surfaces This volume will be a valuable addition to already published volumes 1 8 of Light Scattering Reviews *Light Scattering Reviews 2* Alexander A. Kokhanovsky, 2007-01-26 **Light Scattering Reviews 7** Alexander A. Kokhanovsky, 2012-08-23 Light Scattering Reviews vol 7 is aimed at the description of modern advances in radiative transfer and light scattering The following topics will be considered the general purpose discrete ordinate algorithm DISORT for radiative transfer fast radiative transfer techniques use of polarization in remote sensing Markovian approach for radiative transfer in cloudy atmospheres coherent and incoherent backscattering by turbid media and surfaces advances in radiative transfer methods as used for luminiscence tomography optical properties of aerosol ice crystals snow and oceanic water This volume will be a valuable addition to already published volumes 1 6 of Light Scattering Reviews

Light Scattering Reviews, Vol. 6 Alexander A. Kokhanovsky, 2011-09-23 This is the next volume in series of Light Scattering Reviews Volumes 1-5 have already been printed by Springer The volume is composed of several papers usually 10 of leading researchers in the respective field The main focus of this book is light scattering radiative transfer and optics of snow

Light Scattering Reviews Alexander A. Kokhanovsky, 2006-02-14 This book provides an account of recent developments in light scattering media optics Leading researchers focus on both the theoretical and experimental results in the area In particular light scattering by ice crystals soil particles and biological particles is considered This volume first discusses single light scattering followed by multiple light scattering and finally examines possible applications in combustion and marine research

Light Scattering Reviews, Volume 11 Alexander Kokhanovsky, 2016-05-12 This is the eleventh volume in the series Light Scattering Reviews devoted to current knowledge of light scattering problems and both experimental and theoretical research techniques related to their solution The focus of this volume is to describe modern advances in radiative transfer and light scattering optics This book brings together the most recent studies on light radiative transfer in the terrestrial atmosphere while also reviewing environmental polarimetry The book is divided into nine chapters the first four chapters review recent advances in modern radiative transfer theory and provide detailed descriptions of radiative transfer codes e.g. DISORT and CRTM Approximate solutions of integro-differential radiative transfer equations for turbid media with different shapes spheres cylinders plane-parallel layers are detailed chapters 5 to 8 focus on studies of light scattering by single particles and radially inhomogeneous media the final chapter discusses the environmental polarimetry of man-made objects

Light Scattering Media Optics Alex A. Kokhanovsky, 2004-08-05 The theory of the scattering of light by small particles is very important in a wide range of applications in atmospheric physics and atmospheric optics ocean optics remote sensing astronomy and astrophysics and biological optics This book summarises current knowledge of the optical properties of single small particles and natural light scattering media such as snow clouds foam aerosols etc The book considers both single and multiple light scattering regimes together with light scattering and radiative transfer in close-packed media The third edition incorporates new findings in the area of light scattering media optics in an updated version of the text

Light Scattering Reviews 4 Alexander A. Kokhanovsky, 2009-07-25 This fourth volume of Light Scattering Reviews is composed of three parts The first part is concerned with theoretical and experimental studies of single light scattering by small nonspherical particles Light scattering by small particles such as for instance droplets in the terrestrial clouds is a well-understood area of physical optics On the other hand exact theoretical calculations of light scattering patterns for most of nonspherical and irregularly shaped particles can be performed only for the restricted values of the size parameter which is proportional to the ratio of the characteristic size of the particle to the wavelength For the large nonspherical particles approximations are used e.g. ray optics The exact theoretical techniques such as the T-matrix method cannot be used for extremely large particles such as those in ice clouds because then the size parameter in the visible range is the

characteristic size radius for spheres and the associated numerical codes become unstable and produce wrong answers Yet another problem is due to the fact that particles in many turbid media e g dust clouds cannot be characterized by a single shape Often refractive indices also vary Because of problems with theoretical calculations experimental i e laboratory investigations are important for the characterization and understanding of the optical properties of such types of particles The rst paper in this volume written by B Gustafson is aimed at the descr

tion of scaled analogue experiments in electromagnetic scattering **Light Scattering Reviews 5** Alexander A. Kokhanovsky, 2010-08-05 Light scattering by densely packed inhomogeneous media is a particularly challenging optics problem In most cases only approximate methods are used for the calculations However in the case where only a small number of macroscopic scattering particles are in contact clusters or aggregates it is possible to obtain exact results solving Maxwell's equations Simulations are possible however only for a relatively small number of particles especially if their sizes are larger than the wavelength of incident light The rst review chapter in Part I of this volume prepared by Yasuhiko Okada presents modern numerical techniques used for the simulation of optical characteristics of densely packed groups of spherical particles In this case Mie theory cannot provide accurate results because particles are located in the near field of each other and strongly interact As a matter of fact Maxwell's equations must be solved not for each particle separately but for the ensemble as a whole in this case The author describes techniques for the generation of shapes of aggregates The orientation averaging is performed by a numerical integration with respect to Euler angles The numerical aspects of various techniques such as the T matrix method discrete dipole approximation the finite difference time domain method effective medium theory and generalized multi particle Mie solution are presented Recent advances in numerical techniques such as the grouping and adding method and also numerical orientation averaging using a Monte Carlo method are discussed in great depth **Light Scattering Reviews 10** Alexander A. Kokhanovsky, 2015-07-13 The work is aimed at

the review of hot topics in modern light scattering and radiative transfer A special attention will be given to the description of the methods of integro differential radiative transfer equation solution In particular the asymptotic radiative transfer and the method of discrete ordinates will be considered A comprehensive review of light absorption in the terrestrial atmosphere will be given as well The inverse problem solution will be reviewed as well **Springer Series in Light Scattering**

Alexander A. Kokhanovsky, 2019 This book presents a survey of modern theoretical techniques in studies of radiative transfer and light scattering phenomena in turbid media It offers a comprehensive analysis of polarized radiative transfer and also discusses advances in planetary spectroscopy as far as aerosol layer height determination is of interest Further it describes approximate methods of the radiative transfer equation solution for a special case of strongly scattering media A separate chapter focuses on optical properties of Black Carbon aggregates *Springer Series in Light Scattering* Alexander

Sharma, David J. Sommerford, 2009-09-02 This book deals with a particular class of approximation methods in the context of light scattering by small particles Soft particles occur in ocean optics biomedical optics atmospheric optics and in many industrial applications This class of approximations has been termed as eikonal or soft particle approximations The study of these approximations is very important because soft particles occur abundantly in nature
