Network Flows and Monotropic Optimization R. Tyrell Rockafellar, 1999-06-01 A rigorous and comprehensive treatment of network flow theory and monotropic optimization by one of the world's most renowned applied mathematicians This classic textbook covers

extensively the duality theory and the algorithms of linear and nonlinear network optimization optimization and their significant extensions to monotropic programming separable convex constrained optimization problems including linear programs It complements our other book on the subject of network optimization Network Optimization Continuous and Discrete Models Athena Scientific 1998 Monotropic programming problems are characterized by a rich interplay between combinatorial structure and convexity properties Rockafellar develops for the first time algorithms and a remarkably complete duality theory for these problems Among its special features the book a Treats in depth the duality theory for linear and nonlinear network optimization b Uses a rigorous step by step approach to develop the principal network optimization algorithms c Covers the main algorithms for specialized network problems such as max flow feasibility assignment and shortest path d Develops in detail the theory of monotropic programming based on the author s highly acclaimed research e Contains many examples illustrations and exercises f Contains much new material not found in any other textbook

Integer Programming and Network Flows Te Chiang Hu, 1969 Linear programming Network flows Integer programming **Large Scale Linear and Integer Optimization: A Unified Approach** Richard Kipp Martin, 1999 In this book Kipp Martin has systematically provided users with a unified treatment of the algorithms and the implementation of the algorithms that are important in solving large problems Parts I and II of Large Scale Linear and Integer Programming provide an introduction to linear optimization using two simple but unifying ideas projection and inverse projection The ideas of projection and inverse projection are also extended to integer linear optimization With the projection inverse projection approach theoretical results in integer linear optimization become much more analogous to their linear optimization counterparts Hence with an understanding of these two concepts the reader is equipped to understand fundamental theorems in an intuitive way Part III presents the most important algorithms that are used in commercial software for solving real world problems Part IV shows how to take advantage of the special structure in very large scale applications through decomposition Part V describes how to take advantage of special structure by modifying and enhancing the algorithms developed in Part III This section contains a discussion of the current research in linear and integer linear programming The author also shows in Part V how to take different problem formulations and appropriately modify them so that the algorithms from Part III are more efficient Again the projection and inverse projection concepts are used in Part V to present the current research in linear and integer linear optimization in a very unified way Studyguide for Linear Programming and Network Flows by Bazaraa, Mokhtar S. Operations Research in Transportation Systems A.S. Belenky, 2013-06-29 The scientific monograph of a survey kind presented to the reader's attention deals with fundamental ideas and basic schemes of optimization methods that can be effectively used for solving strategic planning and operations management problems related in particular to transportation. This monograph is an English translation of a considerable part of the author's book with a similar title that was published in Russian in 1992. The material of the monograph embraces methods of linear and nonlinear programming, nonsmooth and nonconvex optimization, integer programming, solving problems on graphs and solving problems with mixed variables, routing, scheduling, solving network flow problems and solving the transportation problem, stochastic programming, multicriteria optimization, game theory and optimization on fuzzy sets and under fuzzy goals, optimal control of systems described by ordinary differential equations, partial differential equations, generalized differential equations, differential inclusions and functional equations with a variable that can assume only discrete values and some other methods that are based on or adjoin to the listed ones.

Network flows and network design in theory and practice Jannik Matuschke, 2014 Network flow and network design problems arise in various application areas of combinatorial optimization, e.g. in transportation, production or telecommunication. This thesis contributes new results to four different problem classes from this area, providing models and algorithms with immediate practical impact as well as theoretical insights into complexity and combinatorial structure of network optimization problems. i We introduce a new model for tactical transportation planning that employs a cyclic network expansion to integrate routing and inventory decisions into a unified capacitated network design formulation. We also devise several algorithmic approaches to solve the resulting optimization problem and demonstrate the applicability of our approach on a set of real world logistic networks. ii We present approximation algorithms for combined location and network design problems, including the first constant factor approximation for capacitated location routing. iii We derive a max flow min cut theorem for abstract flows over time, a generalization of the well known work of Ford and Fulkerson that restricts to a minimal set of structural requirements. iv We devise algorithms for finding orientations of embedded graphs with degree constraints on vertices and faces, answering an open question by Frank.

Einen formalen Ansatz zur Lösung dieser Probleme, der auf der Auswertung von Material fußt, das ein Geographisches Informationssystem bietet, stellt dieses Buch vor.
