Supply Chain Engineering Marc Goetschalckx, 2011-08-11

The focus of Supply Chain Engineering is the engineering design and planning of supply chain systems. There exists a very large variety of supply chain system types all with different goals, constraints and decisions but a systematic approach for the design and planning of any supply chain can be based on the principles and methods of system engineering. In this book, author Marc Goetschalckx presents material developed at the Georgia Tech Supply Chain and Logistics Institute, the largest supply chain and logistics research and education program in the world. The book can be roughly divided into four sections. The first section focuses on data management. Since most of planning and design requires making decisions today so that supply chain functions can be executed efficiently in the future, this section introduces forecasting principles and techniques. The second section of the book focuses on transportation systems. First, the characteristics of transportation assets and infrastructure are shown. Then four chapters focus on the planning of transportation activities depending on who controls the transportation assets. The third section of the book is focused on storing goods and the last section of the book is focused on supply chain systems that consider simultaneously procurement, production and transportation and inventory as well as the design of the supply chain infrastructure or network design. In each chapter, first a model of the process being studied is developed followed by a description of practical solution algorithms. More advanced material is typically described in appendices. This makes it possible to use an integrated, breath-first treatment of supply chain systems by using the initial material in each chapter. A more in-depth treatment of a specific topic or process can be found towards the end of each chapter. End of chapter exercises are included throughout. This text is suitable for several target audiences. The first target is a course for upper-level undergraduate students on supply chains. The second target is the use in a capstone senior design project in the supply chain area. The third target is an introductory course on supply chains either in a master of engineering or a master of business administration program and the final audience consists of students attending logistics or supply chain post graduate or continuing education courses.

Stochastic and Statistical Methods in Hydrology and Environmental Engineering Keith W. Hipel, 2012-12-06

Objectives The current global environmental crisis has reinforced the need for developing flexible mathematical models to obtain a better understanding of environmental problems so that effective remedial action can be taken Because natural phenomena occurring in hydrology and environmental engineering usually behave in random and probabilistic fashions stochastic and statistical models have major roles to play in the protection and restoration of our natural environment Consequently the main objective of this edited volume is to present some of the most up to date and promising approaches to stochastic and statistical modelling especially with respect to groundwater and surface water applications

Contents As shown in the Table of Contents the book is subdivided into the following main parts GENERAL ISSUES PART I PART II GROUNDWATER PART III SURFACE WATER PART IV STOCHASTIC OPTIMIZATION PART V MOMENT ANALYSIS PART VI OTHER TOPICS Part I raises some thought provoking issues about probabilistic modelling of hydro logical and environmental systems The first two papers in Part I are in fact keynote papers delivered at an international environmetrics conference held at the University of Waterloo in June 1993 in honour of Professor T E Unny In his keynote pa per Dr S J Burges of the University of Washington places into perspective the historical and future roles of stochastic modelling in hydrology and environmental engineering Additionally Dr Burges stresses the need for developing a sound scien tific basis for the field of hydrology Professor P E

Decomposition Techniques in Mathematical Programming Antonio J. Conejo, Enrique Castillo, Roberto Minguez, Raquel Garcia-Bertrand, 2006-04-28

Optimization plainly dominates the design planning operation and c trol of engineering systems This is a book on optimization that considers particular cases of optimization problems those with a decomposable str ture that can be advantageously exploited Those decomposable optimization problems are ubiquitous in engineering and science applications The book considers problems with both complicating constraints and complicating va ables and analyzes linear and nonlinear problems with and without in ger variables The decomposition techniques analyzed include Dantzig Wolfe Benders Lagrangian relaxation Augmented Lagrangian decomposition and others Heuristic techniques are also considered Additionally a comprehensive sensitivity analysis for characterizing the solution of optimization problems is carried out This material is particularly novel and of high

practical interest This book is built based on many clarifying illustrative and computational examples which facilitate the learning procedure For the sake of clarity theoretical concepts and computational algorithms are assembled based on these examples The results are simplicity clarity and easy learning We feel that this book is needed by the engineering community that has to tackle complex optimization problems particularly by practitioners and researchers in Engineering Operations Research and Applied Economics The descriptions of most decomposition techniques are available only in complex and specialized mathematical journals difficult to understand by engineers A book describing a wide range of decomposition techniques emphasizing problem solving and appropriately blending theory and application was not previously available
