

## SIPHON/VACUUM

The somewhat labor-intensive siphon/vacuum method of brewing is well-known for producing an especially clear, not cloudy, cup. The siphon/vacuum coffee maker was invented in the early 1800s but fell out of popularity in the 1900s. However, it has recently attracted renewed interest from coffee connoisseurs, who are interested in bringing the focus back to quality instead of concentrating on convenience.

This coffee maker operates on the principle of the siphon and consists of water vapor. It comprises two glass vessels attached by a siphon that allows water to pass between them, and it is suspended over a heating source. The water is placed in the bottom, and a rubber seal creates a partial vacuum in the lower vessel. A coffee maker is placed over a heat source; the vapor from the water expands on heating and the pressure from the vapor pushes the hot water up the siphon into the top vessel, where the coffee grounds are added, stirred, and then steeped. Once brewing has finished, the heat source is turned off. Upon cooling, the water vapor contracts and the pressure in the lower vessel consequently drops. A partial vacuum of negative pressure is created, sucking the liquid back down through the siphon to fill the lower vessel with the brewed coffee.

Other vacuum-based brewing methods include the Clover machine, a recently invented high-tech brewing system that can now be found in specialty coffee bars worldwide. The single-cup brewer takes up a comparatively large amount of counter real estate. The barista places the ground coffee over a fine filter that sits atop a piston, which then descends into the machine. After the coffee has been steeped, the piston pushes back up, creating a vacuum and sucking the brewed coffee down through valves. The piston then descends once more, pushing the brewed coffee up a tube.
