J. Gavora,D.F. Gerson,J. Luong,A. Storer,J.H. Woodley,2012-12-06 Historically ruminant animals have provided farmers with the ability to utilize marginal lands for the production of high quality food for human consumption Ruminants are able to derive their nourishment from feeds that are not in themselves capable of meeting the nutritional needs of the animal They do this by supporting in the rumen which is a greatly enlarged region of the stomach which precedes the animals digestive system a microbial fermentation system This system partially degrades complex polysaccharides and provides to the animal not only the degradation products chiefly volatile fatty acids but also secondary microbial metabolites and microbial biomass most importantly microbial protein which can be synthesized from inorganic nitrogen sources A ruminant animal is able to survive if not thrive on a diet containing only cellulose a non protein nitrogen source such as urea and trace minerals The capacity of the rumen to process low quality feeds is limited by factors such as rumen volume the time required for digestion of these feeds in the rumen and the ability of the animal to chew the feed Modern ruminant animals have been intensively selected for high production potential but the limited capacity of the rumen fermentation means that this potential cannot be realized by feeding the animal low quality feeds The high production potential of these animals can only be realized by feeding large amounts of readily digestible high quality feeds such as oilseed meals and grains Air Pollution Engineering Manual

Air & Waste Management Association,2000-04-06 This manual characterizes air pollutant emission sources and the technology available to control them It provides industry and government with the guidelines to comply with air pollution standards and equipment used for gases and particulates *Water Purification and Management* José Coca-Prados,Gemma Gutiérrez-Cervelló,2010-10-14 One of the major challenges for many Mediterranean and other countries is finding viable solutions to tackle water shortage Some of the major water quality constraints derive from the high salinity of groundwater and from pollution sources such as untreated domestic sewage fertilizers and pesticides from irrigation drainage industrial effluents and solid waste disposal Wastewater treatment processes involving physico chemical and biological treatment chemical oxidation membrane technologies along with methods of solids concentration and disposal are of special relevance in dealing with these problems This volume contains selected lectures presented at the NATO ADVANCED TRAINING COURSE held in Oviedo November 15 21 2009 and sponsored by the NATO Science for Peace and Security SPS Programme They cover a variety of topics from wastewater treatment methods to cleaner

production strategies as a careful management of water resources is the basis for sustainable development and to avoid potential security threats The reader will benefit from a general view of some of the operations involved in wastewater treatment and solid concentration and disposal methods A proper water reuse and recycling together with efficient solid disposal would contribute to a better use of the resources and a sustainable economic growth particularly in many arid lands of the world Mass Transfer Rates in the Solvent Extraction of Metal Chlorides by Tri-isooctylamine Samuel Wai-Suen
