Great advances have been made in the application of physical methods in the study of the structure of proteins and other biological macromolecules. Optical rotatory dispersion has been successful in solving structural problems and a vast amount of literature has accumulated on this subject. Several review articles appeared between 1961 and 1965 but significant progress has been made since 1965. Important new studies especially on the Cotton effects in the far ultraviolet spectrum have rendered many previous publications obsolete so that a concise monograph should be useful at this time.
