Getting Science Brian Clegg, 2007-04-11 The science in this book is not for the children but for the adults who have to explain it Starting with a whirlwind tour of the great milestones of modern science Getting Science goes on to take each of the main curriculum topics and give it a new twist

Pandigm Science Won H. KIM, 2022-01-01 Science of 21st century needs new paradigm Paradigm shift is initiated from unexplainable fact with current paradigm New paradigm will be initiated from the unexplainable fact This time it could be water memory which is not explained with current science based on materialism New paradigm explains water memory with 3D wave inherent to matter 3D wave is faster than speed of light and exists in the area of imaginary number carrying out its effect as a field with 3D structure similar to original matter 3D wave can be separated from hormone to water 3D wave of hormone in water as separate entity can be interacting with hormone receptor leading to cellular transmission 3D wave of medically effective substances can be stored in water and can be utilized successfully for various diseases 3D wave of matter can be digitized and expressed in 2D space Digitized 3D wave shows the same functionality of original matter through holographic space Digitized 3D wave can be modulated to electricity and change the characteristic of electricity There are enough facts which require new paradigm out of materialism 21st century should be an era for new paradigm beyond materialism

The Meaning of Science Tim Lewens, 2016-01-26 A philosopher of science examines the biggest ethical and moral issues in science today and explains why they matter for all of us scientist and layman alike Science has produced explanations for everything from the mechanisms of insect navigation to the formation of black holes and the workings of black markets But how much can we trust science and can we actually know the world through it How does science work and how does it fail And how can the work of scientists help or hurt everyday people These are not questions that science can answer on its own This is where philosophy of science comes in Studying science without philosophy is to quote Einstein to be like somebody who has seen thousands of trees but has never seen a forest Cambridge philosopher Tim Lewens shows us the forest He walks us through the theories of seminal philosophers of science Karl Popper and Thomas Kuhn and considers what science is how far it can and should reach and how we can determine the nature of its truths and myths These philosophical issues have consequences that stretch far beyond the laboratory For instance What role should scientists have in policy discussions on environmental issues such as fracking What are the biases at play in the search for a biological function of the female orgasm If brain scans can be used to demonstrate that a decision was made several seconds before a person actually makes a conscious choice what does that tell us about the possibility of free will By examining science through this philosophical lens Lewens reveals what physics can teach us about reality what biology teaches us about human nature and what cognitive science teaches us about human freedom A masterful analysis of the biggest scientific and ethical issues of our age The Meaning of Science forces us to confront the practical personal and political purposes of science and why it matters to all of us

Topics include: Why it's vital to get the right support, Revisioning mental health, Working with soul, Healing approaches, Taking responsibility for our healing, Reaching out for support, Finding the right health care professionals, Focussing on success stories, Getting rid of the toxic, Making lifestyle changes, Seeing illness as a gift. *How Moral Philosophy Broke Politics* Robert A. Johnson, 2022-06-29 We live in a remarkable world; science and technology have shifted our understanding of what's possible and transformed our lives. Rain dances and sun worshipping have been replaced by quantum computers, speed of light rockets, and our ever closer inching towards genuine artificial intelligence. But somehow more and more of us are feeling hopeless; we are still ruled by political systems that haven't hugely changed since they fell into place hundreds, arguably thousands, of years ago. The part of our society that makes decisions on everything from our health to our work is almost completely dysfunctional. Politicians aren't held to account by truth, aren't striving for shared visions of human thriving, and are allowed to mix and mash their policies based upon sound bites and media furores rather than actually progressing humankind. All the while having to focus on short-term goals rather than sustainable ideas. *How Moral Philosophy Broke Politics* argues that a rational evidence-based framework for ethics can be developed by drawing all of our moral opinions back to three basic principles that underlie all of our concerns. By doing this we can rationally judge and weigh new policies and decisions in a way which is accountable and whilst still debatable, much easier to find consensus on. If we were to accept this new framework then we would be much better off not just in politics but in all those areas of life which politics affects. The world has changed unrecognisably in the last thousand years whilst politics hasn't changed much at all. We need to start using reason to develop it into something useful. **Judging Science** Kenneth R. Foster, Peter W. Huber, 1999 Attempting to reconcile the law's need for workable rules of evidence with the views of scientific validity and reliability. What is scientific knowledge and when is it reliable? These deceptively simple questions have been the source of endless controversy. In 1993 the Supreme Court handed down a landmark ruling on the use of scientific evidence in federal courts: Federal judges may admit expert scientific evidence only if it merits the label 'scientific knowledge'. The testimony must be scientifically reliable and valid. This book is organized around the criteria set out in the 1993 ruling. Following a general overview, the authors look at issues of fit: whether a plausible theory relates specific facts to the larger factual issues in contention; philosophical concepts such as the falsifiability of scientific claims; scientific error; reliability in science, particularly in fields such as epidemiology and toxicology; the meaning of scientific validity; peer review and the problem of boundary setting; and the risks of confusion and prejudice when presenting science to a jury. The book's conclusion attempts to reconcile the law's need for workable rules of evidence with the views of scientific validity and reliability that emerge from science and other disciplines.
