BIOMES

Take a closer look at the images above. Each is home to a variety of plants and animals, but no two are the same. Although they're all capable to life, there are quite a lot of differences too. Many of these differences are **abiotic**, or have to do with the non-living parts of the environment. Abiotic factors include temperature, the amount of oxygen in the air or water, and the kind of soil present.

Inter: or make your best guess, about some of the abiotic factors in each of the images.

extremely nutrient rich soil. Here you'll find a variety of plants and animals. Due to their dry and hot climate, plants in both savanna and grasslands are adapted to survive relatively common fires.

Desert When we think of deserts, we usually think of a hot and dry place, but did you know that deserts can be cold too? The Gobi Desert in Asia is the largest desert in the world. It's cold there, but there is so little rain (or snow) that it's still considered a desert. Both plants and animals must adapt to dry life in the desert. Many plants, such as cacti, have adapted to survive with very little water, or the ability to remain dormant (similar to hibernation) for a long time.

Forest There are several different kinds of forest biomes, including: The rainforest is most likely the most famous forest. This lush biome is home to a vast number of plants and animals. Rainforests are home to a wide variety of species and are found in many parts of the world. The temperate forest is common in the US, Canada, Europe, and Asia. Here you'll find a variety of trees and animals. In the winter, in fact, that's what this biome is famous for: it's a unique place. The boreal forest is found in the northernmost parts of the world and the winters are cold. In these forests you'll find bears, deer, and wolves.

The tundra is a cold forest with cone-bearing, coniferous trees. It's found in the northernmost parts of the world, in Northern Canada and Russia. The days are long in the summer and short in the winter due to the tilt of the Earth's axis, so there's a lot of light in the summer and a lot of darkness in the winter.

BIOMES

Earth is an amazing planet. It has many different environments that make perfect homes for millions of species. The largest major habitats that exist worldwide are known as **biomes**. Most likely, you're familiar with many of these: desert, rainforest, grassland, etc. Each biome is unique and has its own set of characteristics that make it different from the others. One of the most important factors in maintaining biodiversity, or the amazing variety of life, that makes our Earth so abundant in species and resources.

How many biomes are there? Do all water environments constitute a single aquatic biome? Are all fire-filled ecosystems considered a forest biome? The number of biomes you could simply depend on how specific you'd like to be. Let's take a look at some of the largest biomes, and the abiotic and biotic factors that define them.

Marine

Freshwater

Savanna

For fish, birds, frogs, whales, and other aquatic species.

Grassland

Grassland biomes live up to their name! They're made up of open and very few trees. The two major grassland biomes are the savanna and temperate grassland. The savanna is a warm, dry biome that covers much of Africa and large parts of Australia. These areas have a 6-8 month wet season in the summer and a 4-6 month dry season in the winter. Elephants, giraffes, and other animals live in the savanna. The temperate grasslands, on the other hand, make up the plains of middle America.
