Maksic,2013-03-09 Imagination and shrewd guesswork are powerful instruments for acquiring scientific knowledge 1 H van t Hoff The last decades have witnessed a rapid growth of quantum chemistry and a tremendous increase in the number of very accurate ab initio calculations of the electronic structure of molecules yielding results of admirable accuracy This dramatic progress has opened a new stage in the quantum mechanical

description of matter at the molecular level In the first place highly accurate results provide severe tests of the quantum mechanics Secondly modern quantitative computational ab initio methods can be synergetically combined with various experimental techniques thus enabling precise numerical characterization of molecular properties better than ever anticipated earlier However the role of theory is not exhausted in disclosing the fundamental laws of Nature and production of ever increasing sets of data of high accuracy It has to provide additionally a means of systematization recognition of regularities and rationalization of the myriads of established facts avoiding in this way complete chaos Additional problems are represented by molecular wavefunctions provided by the modern high level computational quantum chemistry methods They involve in principle all the information on molecular system but they are so immensely complex that can not be immediately understood in simple and physically meaningful terms Both of these aspects categorization and interpretation call for conceptual models which should be preferably pictorial transparent intuitively appealing and well founded being sometimes useful for semi quantitative purposes
