Information Retrieval for Music and Motion Meinard Müller, 2007-09-09 A general scenario that has attracted a lot of attention for multimedia information retrieval is based on the query by example paradigm retrieve all documents from a database containing parts or aspects similar to a given data fragment However multimedia objects even though they are similar from a structural or semantic viewpoint often reveal significant spatial or temporal differences This makes content based multimedia retrieval a challenging research field with many unsolved problems Meinard Müller details concepts and algorithms for robust and efficient information retrieval by means of two different types of multimedia data waveform based music data and human motion data In Part I he discusses in depth several approaches in music information retrieval in particular general strategies as well as efficient algorithms for music synchronization audio matching and audio structure analysis He also shows how the analysis results can be used in an advanced audio player to facilitate additional retrieval and browsing functionality In Part II he introduces a general and unified framework for motion analysis retrieval and classification highlighting the design of suitable features the notion of similarity used to compare data streams and data organization The detailed chapters at the beginning of each part give consideration to the interdisciplinary character of this field covering information science digital signal processing audio engineering musicology and computer graphics This first monograph specializing in music and motion retrieval appeals to a wide audience from students at the graduate level and lecturers to scientists working in the above mentioned fields in academia or industry Lecturers and students will benefit from the didactic style and each unit is suitable for stand alone use in specialized graduate courses Researchers will be interested in the detailed description of original research results and their application in real world browsing and retrieval scenarios

Information Retrieval for Music and Motion Meinard Müller, 2009-09-02 Content based multimedia retrieval is a challenging research field with many unsolved problems This monograph details concepts and algorithms for robust and efficient information retrieval of two different types of multimedia data waveform based music data and human motion data It first examines several approaches in music information retrieval in particular general strategies as well as efficient algorithms The book then introduces a general and unified framework for motion analysis retrieval and classification highlighting the design of suitable features the notion of similarity used to compare data streams and data organization

Learning to Listen, Listening to Learn Marcus T. Pearce, 2025-05-28 What accounts for the variety of music witnessed across the world The answer lies in the psychological mechanisms of cultural evolution that combine a creative process of composing ever new forms of music and a perceptual process of learning to appreciate listening to them This book develops and tests a theory of the psychological mechanisms that enable listeners to learn the structure of their culturally situated musical environments so as to be able to perceive and appreciate music The central hypothesis is that music perception depends critically on mechanisms of statistical learning and probabilistic prediction These mechanisms are implemented in a computational model whose behaviour is analysed in detail through simulations of psychological experiments The results demonstrate that the model can account for predictions generated by listeners for the pitch timing and harmonies of music While prediction is an important psychological mechanism in and of itself the evidence presented shows how it also lays the foundation for a broader account of music perception encompassing memory auditory scene analysis similarity perception complexity perception affect and aesthetic experience The proposed theory makes concrete predictions for differences in perception between listeners from different cultures and the developmental trajectories that result in these differences These predictions are tested and corroborated with respect to both the incidental cultural experience of non musicians and the

formal cultural training of musicians Because the approach rests fundamentally on mechanisms of statistical learning it generalises naturally to other cultural domains including natural language visual media and dance **A-E** Library of Congress.
