Non-invasive and Non-destructive Methods for Food Integrity Ana María Jiménez-Carvelo, Alejandra Arroyo-Cerezo, Luis Cuadros-Rodríguez, 2024-12-16 There is an increasing need for the food industry to provide information to ensure quality requirements and prevent the food fraud applying in situ and on line technologies for full process control along the food chain In today s information age consumers want to be able to have as much information as possible about products quickly and efficiently Therefore the rapid detection of indicators that determine food quality and safety risks helps to ensure an effective and comprehensive food sovereignty system For this purpose the most powerful and commonly used analytical techniques are liquid or gas chromatography both coupled to different detection systems The use of these analytical techniques involves long analysis times and prior procedures of fitness for measuring such as sample pre treatment in which the use of reagents and chemical solvents that may be hazardous or

harmful to the environment is common. These facts highlight the need for the development of new analytical methods that offer the possibility of rapid non-invasive on-site environmentally friendly analyses that can be carried out along the entire production chain. In addition, recent technological developments and advances in data mining and machine learning offer the opportunity to introduce changes that could transform the role of food integrity. Non-invasive and Non-destructive Methods for Food Integrity is dedicated to describing the fundamentals and applications of existing analytical technologies and the current state of these techniques at industrial level. The text utilizes reported studies and applications differentiating by particular food and beverage groups in order to provide a comprehensive and detailed overview of the current state of the art of non-invasive non-destructive analytical techniques for food quality and integrity. For each technique covered, an introduction is included and the chemical information obtained and why this technology is useful for food analysis. Information on the instrumentation available for the application of each technique in food is also provided, as well as information on data processing with reference to the treatment of the signal obtained and the use of chemometrics. Applications published in scientific literature are detailed for different categories of similar foods based on the techniques that are already used for the routine control of food integrity. This book provides guidance for potential users in the food industries and quality control laboratories for choosing which technology to implement based on the type of product and the results to be obtained.

Novel Food Preservation and Microbial Assessment Techniques Ioannis S. Boziaris, 2014-04-14 Demand for minimally processed foods has resulted in the development of innovative non-thermal food preservation methods such as high pressure, sonication, ozone and UV treatment. This book presents a summary of these novel food processing techniques. It also covers new methods used to monitor microbial activity including spectroscopic methods FT-IR and Raman, molecular and electronic noses and DNA-based methods.

Spectroscopic Methods in Food Analysis Adriana S. Franca, Leo M.L. Nollet, 2017-12-14 Given the inherent complexity of food products, most instrumental techniques employed for quality and authenticity evaluation, e.g. chromatographic methods, are time-demanding, expensive and involve a considerable amount of manual labor. Therefore, there has been an increasing interest in simpler, faster and reliable analytical methods for assessing food quality attributes. *Spectroscopic Methods in Food Analysis* presents the basic concepts of spectroscopic methods together with a discussion on the most important applications in food analysis. The determination of product quality and authenticity and the detection of adulteration are major issues in the food industry, causing concern among consumers and special attention among food manufacturers. As such, this book explains why spectroscopic methods have been extensively employed to the analysis of food products as they often require minimal or no sample preparation, provide rapid and on-line analysis and have the potential to run multiple tests on a single sample, i.e. non-destructive. This book consists of concepts related to food quality and authenticity that are quite broad, given the different demands of the manufacturer, the consumer, the surveillance and the legislative bodies that ultimately provide healthy and safe products.
