Cerebral Sinus Thrombosis A. Baethmann, K. Einhäupl, O. Kempfski, 2013-12-19 Contrary to the neurological manifestations of arterial cerebral blood flow disturbances respective conditions resulting from obstruction of the cerebro venous system are far less well understood Hence cerebral sinus vein thrombosis CSVT ranks prominently among the group of neglected diseases of the brain This might be attributable a to the diagnostic difficulties of the disorder and b to the fact that CSVT is associated with a host of heterogeneous neurological symptoms which often are not specific for the underlying venous flow disorder Another complicating aspect is that CSVT is a consequence of other diseases as disparate as focal infection trauma neoplasia or a thrombosis disposition caused by oral contraceptive use Although progress has been made in establishing the correct diagnosis of the syndrome many problems remain as the discussions contained within this volume vividly demonstrate The same is true for the present understanding of the pathophysiological basis of the disease eg concerning the cerebro venous circulation the hemodynamic and neuropathological consequences in particular Part of these deficits may be attributed to a scarcity of solid experimental data due to the limited availability of animal models However relevant experimental models are required for an in depth analysis of the pathophysiological mechanisms eg causing brain tissue damage in relationship with the topographical distribution of the venous flow obstruction and most importantly for the testing of specific methods of treatment

Cerebral Venous System in Acute and Chronic Brain Injuries Min Lou, Jianmin Zhang, Yilong Wang, Yan Qu, Wuwei Feng, Xunming Ji, John H. Zhang, 2018-11-10 Provides important information from anatomy to pathophysiology and covers most neurological disorders

that involve venous circulation Venous circulation has not been extensively studied and we know relatively little about cerebral venous circulation Venous circulation contributes to half of the brain circulation and about 70% of the blood in the brain is venous blood Veins and venules play extremely important roles in brain circulation especially during pathologies such as brain edema BBB disruption elevation of intracranial pressure during and after ischemic and hemorrhagic stroke events traumatic brain injury neurodegenerative disorders in adults and newborns Occlusion of veins or sinuses by thrombus compression of veins and venules by tumor and edematous tissues elevation of venous pressure during cranial hypertension all lead to fatal insults such as venous infarction and hemorrhage

Lindgren, 2022 *Ischemic Stroke of Brain* Pratap Sanchetee, 2018-10-10 The stroke is the third leading cause of death and disability across the globe We have evolved from a sense of frustration and helplessness to proactive and effective management in the hyperacute and acute phase of a stroke The aim is to salvage the ischemic brain and turn it again into a viable and functional one Advances in imaging and newer therapeutic strategies of this devastating illness have changed our outlook The modern management of an ischemic stroke involves intravenous thrombolysis within a window period of four and half hours Endovascular management with newer stent retrievers has a higher rate of recanalization with an extended therapeutic window A new era has emerged in the management of ischemic stroke treatment This book written by experts aims to improve the understanding of stroke medicine for postgraduate medical students in medicine and neurology who have an interest in stroke care The Cerebral Venous System and Its Disorders John P. cohort Patients and methods This was a retrospective and prospective study conducted from January 2013 to December 2016 at the Neurology department of Fann teaching hospital Dakar Senegal All the patients hospitalized or followed for CVT were included The diagnosis was established with neuroimaging CT scan and or MRI Results Thirty patients were collected The average age was 34 years 10 62 The sex ratio M F was 0 43 Onset was subacute in 90 % of cases The average admission extension of time was 37 days 1 8 month The main clinical signs were headache 86 7% vomiting 60 % hemiplegia 56 7 % seizures 43 3 % and fever 33 3 % Thrombosis of the lateral sinus 46 7 % and the superior sagittal sinus 33 3 % was the most common The location was multiple in 1 3 of the patients The main etiological factors were mostly gynecological obstetric All patients had anticoagulation The average hospital stay was 21 days 7 47 The short term evolution 3 months was mostly favorable 96 7% Conclusion CVT is a young woman neurological disease An exhaustive etiological investigation and a longer multicenter study are necessary *Frontiers of Neurology and Neuroscience* ,2005
