

1 ENGINE

[1] AUTOMATIC PRESSURE RELIEVING MECHANISM

The automatic pressure relieving mechanism is installed on the camshaft to facilitate a start of the engine.

When the engine is started, the fly weight (1) located on the camshaft (7) undergoes a decompression spring tension and pushes up the tappet (3) (exhaust valve side) via the decompression pin (6).

By so doing, the compression is relieved and the recoil tension is reduced.

When the engine speed has reached 1000-1100 rpm, both the fly weight and the decompression pin are pressed against the inner wall of the device by the centrifugal force to permit normal running state.
