A Study on New Approaches in Coherent X-ray Microscopy of Biological Specimens Klaus Giewekemeyer, 2011 The use of coherent x rays for microscopic imaging has seen a rapid and ongoing development within the past decade driven by an increasing availability of highly brilliant and coherent sources worldwide Accordingly novel methods have been developed which replace the microscope's objective lens by a numerical reconstruction scheme The aim of the present work is to study how very recent experimental and algorithmic developments in the field can be implemented towards a highly sensitive and fully quantitative microscopy method for imaging of biological cells To this end different experimental approaches are studied based on coherent far field as well as near field diffraction At first an application of the novel ptychographic imaging method to single biological cells is presented In particular it is demonstrated how weakly scattering biological specimens can be imaged with fully quantitative density contrast Alongside a successful extension of the method towards soft x ray energies is described In the second part of the work it is shown how x ray waveguides can be used as a point source for propagation based microscopy of single cells in the hard x ray regime The specifically devised iterative reconstruction scheme allows for full quantitativity and high sensitivity and thus enables an application to single biological cells The work contains a thorough introduction into the x ray optical methods applied and aims at a useful and self contained overview on aspects of signal and Fourier theory relevant for the used numerical propagation schemes

Classical and Evolutionary Algorithms in the Optimization of Optical Systems Darko Vasiljevic, 2012-12-06 The optimization of optical systems is a very old problem As soon as lens designers discovered the possibility of designing optical systems the desire to improve those systems by the means of optimization began For a long time the optimization of optical systems was connected with well known mathematical theories of optimization which gave good results but required lens designers to have a strong knowledge about optimized optical systems In recent years modern optimization methods have been developed that are not primarily based on the known mathematical theories of optimization but rather on analogies with nature While searching for successful optimization methods scientists noticed that the method of organic evolution well known Darwinian theory of evolution represented an optimal strategy of adaptation of living organisms to their changing environment If the method of organic evolution was very successful in nature the principles of

the biological evolution could be applied to the problem of optimization of complex technical systems Ophthalmology E-Book Myron Yanoff, Jay S.
