E. Nicholls,2012-12-06 In ordinary mathematics an equation can be written down which is syntactically correct but for which no solution exists For example consider the equation $x \times 1$ defined over the real numbers there is no value of x

which satisfies it Similarly it is possible to specify objects using the formal specification language Z [3, 4] which can not possibly exist Such specifications are called inconsistent and can arise in a number of ways Example 1 The following Z specification of a function f from integers to integers $f: \mathbb{Z} \rightarrow \mathbb{Z}$ is inconsistent because axiom i gives $f(0) = 1$ while axiom ii gives $f(0) = 2$ This contradicts the fact that f was declared as a function that is f must have a unique result when applied to an argument Hence no such f exists Furthermore iff $0 \neq 1$ and $0 = 2$ then $1 = 2$ can be deduced From $1 = 2$ anything can be deduced thus showing the danger of an inconsistent specification Note that all examples and proofs start with the word Example or Proof and end with the symbol $\square$
