Information Theory Tools for Visualization Min Chen, Miquel Feixas, Ivan Viola, Anton Bardera, Han-Wei Shen, Mateu Sbert, 2016-09-19 This book explores Information theory IT tools which have become state of the art to solve and understand better many of the problems in visualization This book covers all relevant literature up to date It is the first book solely devoted to this subject written by leading experts in the field

Abstract Methods In Information Theory (Second Edition) Yuichiro Kakehara, 2016-06-09 Information Theory is studied from the following points of view 1 the theory of entropy as amount of information 2 the mathematical structure of information sources probability measures and 3 the theory of information channels Shannon entropy and Kolmogorov Sinai entropy are defined and their basic properties are examined where the latter entropy is extended to be a linear functional on a certain set of measures Ergodic and mixing properties of stationary sources are studied as well as AMS asymptotically mean stationary sources The main purpose of this book is to present information channels in the environment of functional analysis and operator theory as well as probability theory Ergodic mixing and AMS channels are also considered in detail with some illustrations In this second edition channel operators are studied in many aspects which generalize ordinary channels Also Gaussian channels are considered in detail together with Gaussian measures on a Hilbert space The Special Topics chapter deals with features such as generalized capacity channels with an intermediate noncommutative system and von Neumann algebra method for channels Finally quantum noncommutative information channels are examined in an independent chapter which may be regarded as an introduction to quantum information theory Von Neumann entropy is introduced and its generalization to a C algebra setting is given Basic results on quantum channels and entropy transmission are also considered

Information and Communication Technology in Social Science Research D. Kumar Dr. N. Panchanatham,

Mathematics of Information Stefan Schäffler, 2024-07-22 Starting with the Shannon Wiener approach to mathematical information theory allowing a mathematical measurement of an amount of information the book begins by defining the terms message and information and axiomatically assigning an amount of information to a probability The second part explores countable probability spaces leading to the definition of Shannon entropy based on the average amount of information three classical applications of Shannon entropy in statistical physics mathematical statistics and communication engineering are presented along with an initial glimpse into the field of quantum information The third part is dedicated to general probability spaces focusing on the information theoretical analysis of dynamic systems The book builds on bachelor level knowledge and is primarily intended for mathematicians and computer

the aquatic and limnological sciences for students of environmental science as well as students of environmental engineering It also serves as a reference for engineers and scientists involved in the management regulation or restoration of freshwater environments

Machine and Deep Learning Algorithms and Applications Uday Shankar Shanthamallu,Andreas Spanias,2022-05-31 This book introduces basic machine learning concepts and applications for a broad audience that includes students faculty and industry practitioners We begin by describing how machine learning provides capabilities to computers and embedded systems to learn from data A typical machine learning algorithm involves training and generally the performance of a machine learning model improves with more training data Deep learning is a sub area of machine learning that involves extensive use of layers of artificial neural networks typically trained on massive amounts of data Machine and deep learning methods are often used in contemporary data science tasks to address the growing data sets and detect cluster and classify data patterns Although machine learning commercial interest has grown relatively recently the roots of machine learning go back to decades ago We note that nearly all organizations including industry government defense and health are using machine learning to address a variety of needs and applications The machine learning paradigms presented can be broadly divided into the following three categories supervised learning unsupervised learning and semi supervised learning Supervised learning algorithms focus on learning a mapping function and they are trained with supervision on labeled data Supervised learning is further sub divided into classification and regression algorithms Unsupervised learning typically does not have access to ground truth and often the goal is to learn or uncover the hidden pattern in the data Through semi supervised learning one can effectively utilize a large volume of unlabeled data and a limited amount of labeled data to improve machine learning model performances Deep learning and neural networks are also covered in this book Deep neural networks have attracted a lot of interest during the last ten years due to the availability of graphics processing units GPU computational power big data and new software platforms They have strong capabilities in terms of learning complex mapping functions for different types of data We organize the book as follows The book starts by introducing concepts in supervised unsupervised and semi supervised learning Several algorithms and their inner workings are presented within these three categories We then continue with a

brief introduction to artificial neural network algorithms and their properties In addition we cover an array of applications and provide extensive bibliography The book ends with a summary of the key machine learning concepts
