considerable effort has been devoted to investigating the role of many virulence traits in the pathogenic outcome of fungal infections New virulence factors hypoxia adaptation CO₂ sensing pH regulation micronutrient acquisition secondary metabolites immunity regulators etc have been reported and their molecular mechanisms of action are being thoroughly investigated The recent application of gene editing technologies such as CRISPr Cas9 has opened a whole new window to the discovery of new fungal virulence factors Accurate fungal genotyping Next Generation Sequencing and RNAseq approaches will undoubtedly provide new clues to interpret the plethora of molecular interactions controlling these complex systems Unraveling their intimate regulatory details will provide insights for a more target focused search or a rational design of more specific antifungal agents This Special Issue is show significant discoveries proofs of concept of new theories or relevant observations in fungal pathogenesis and its regulation Dr Fernando Leal Guest Editor

Handbook of Muscle Variations and Anomalies in Humans Eve K. Boyle, Vondel S. E. Mahon, Rui Diogo, 2022-03-08 Most textbooks and atlases of human anatomy chronicle only a few cases of muscle variations in the normal human population or of muscle anomalies within congenital malformations Consequently there is a misconception of what is considered normal human anatomy and what that looks like Each person within the normal population has at least a few muscle variations and there are millions of individuals born globally each year with muscle anomalies There are crucial knowledge gaps between what is taught what students learn what textbooks and atlases show and what truly happens in nature and within our species This handbook fills this gap by 1 providing a comparative evolutionary context for muscle variations and defects in humans 2 summarizing the major types of variations and anomalies found in humans and 3 including didactic figures for a visually engaging learning experience This book is of interest to students professors and researchers in biological anthropology comparative anatomy functional morphology zoology and evolutionary and developmental biology as well as to clinicians and practicing health professionals Key Features Summarizes most recorded

The Convergent Evolution of Agriculture in Humans and Insects Ted R Schultz, Richard Gawne, Peter N Peregrine, 2022-02-15 Contributors explore common elements in the evolutionary histories of both human and insect agriculture resulting from convergent evolution During the past 12 000 years agriculture originated in humans as many as twenty three times and during the past 65 million years agriculture also originated in nonhuman animals at least twenty times and in insects at least fifteen times It is much more likely that these independent origins represent similar solutions to the challenge of growing food than that they are due purely to chance This volume seeks to identify common elements in the evolutionary histories of both human and insect agriculture that are the results of convergent evolution The goal is to create a new synthetic field that characterizes quantifies and empirically documents the evolutionary and ecological mechanisms that drive both human and nonhuman agriculture The contributors report on the results of quantitative analyses comparing human and nonhuman agriculture discuss evolutionary conflicts of interest between and among farmers and cultivars and how they interfere with efficiencies of agricultural symbiosis describe in detail agriculture in termites ambrosia beetles and ants and consider patterns of evolutionary convergence in different aspects of agriculture comparing fungal parasites of ant agriculture with fungal parasites of human agriculture analyzing the effects of agriculture on human anatomy and tracing the similarities and differences between the evolution of agriculture in humans and in a single relatively well studied insect group fungus farming ants

Sperm Competition in Humans Todd K. Shackelford, Nicholas Pound, 2006-11-22 In species with internal fertilization sperm competition occurs when the sperm of two or more males simultaneously occupy the reproductive tract of a female and compete to fertilize an egg Parker 1970 A large body of empirical research has demonstrated that as predicted by sperm competition theory males and females in many species possess anatomical behavioral and physiological adaptations that have evolved to deal with the adaptive challenges associated with sperm competition Moreover in recent years evolutionary biologists and psychologists have begun to examine the extent to which sperm competition may have been an important selective pressure during human evolution

Some research has suggested that male humans like males of many bird insect and rodent species might be able to adjust the number of sperm they inseminate according to the risk of sperm competition Other research has examined whether such responses might be accompanied by psychological changes that motivate human males to pursue copulations when the risk of sperm competition is high Furthermore there is research suggesting that aspects of human penile anatomy might function to enhance success in sperm competition Much of this work has been controversial some of the findings have been disputed and others have been greeted with skepticism However the idea that some aspects of human psychology and behavior might best be understood as adaptations to sperm competition remains intriguing and in certain cases very persuasive
