Care of Automobiles: A Non-Technical Treatise for the Business and Professional Man (1908) Burton Jay Paris, 2008-06-01

The Operation, Care and Repair of Automobiles Albert L. Glough, 2003. Digital book consists of a large number of page images. *The Operation, Care and Repair of Automobiles (Classic Reprint)* Horseless Age, 2018-02-05. Excerpt from *The Operation, Care and Repair of Automobiles*. In the present articles, electrical phenomena will be explained by hydraulic phenomena, that is, phenomena of flowing water, which are familiar to everyone. Almost every electrical phenomenon can be thus explained in simple language easily comprehended by the lay mind. Water flows under the influence of the force of gravity from a higher point to a lower provided there is an unobstructed path for the flow between these two points. The flow is then said to be due to a difference of level between the two points. Similarly, an electric flow or current in a conductor is due to a difference of electrical level or a difference of potential as it is known technically. In nature, water is continually raised by the process of evaporation and in a similar manner, high electrical potentials are occasionally created by meteorological processes. In practice, however, if we want water at a high level in order to create a flow, we usually find it necessary to raise it there by means of a pump. Similarly, if we desire to produce a high electrical potential in order to obtain an electrical current, we must make use of an apparatus capable of creating a difference of potential. Such an apparatus is ordinarily called a source of electromotive force. The terms difference of potential and electromotive force are almost synonymous. They bear to each other about the same relation as difference of level and pressure in hydraulics. As is well known, a certain difference in water level corresponds to a certain definite pressure per square inch, so that for many purposes, difference of level expresses the same thing as pressure per square inch, although fundamentally these terms express different things. This difference between the two electrical terms is particularly to be noted. If there is simply a difference of potential between two points, this is wiped out as soon as the points are connected by a conductor, but if there is an electromotive force active between them, the difference of potential will be maintained between the points even if they be connected by a conductor.
