*Howard Aiken* I. Bernard Cohen, 2000 Biography of Howard Aiken a major figure of the early digital era by a major historian of science who was also a colleague of Aiken's at Harvard Howard Hathaway Aiken 1900-1973 was a major figure of the early digital era He is best known for his first machine the IBM Automatic Sequence Controlled Calculator or Harvard Mark I conceived in 1937 and put into operation in 1944 But he also made significant contributions to the development of applications for the new machines and to the creation of a university curriculum for computer science This biography of Aiken by a major historian of science who was also a colleague of Aiken's at Harvard offers a clear and often entertaining introduction to Aiken and his times Aiken's Mark I was the most intensely used of the early large scale general purpose automatic digital computers and it had a significant impact on the machines that followed Aiken also proselytized for the computer among scientists scholars and businesspeople and explored novel applications in data processing automatic billing and production control But his most lasting contribution may have been the students who received degrees under him and then took prominent positions in academia and industry I Bernard Cohen argues convincingly for Aiken's significance as a shaper of the computer world in which we now live The Sound of Freedom James P. Rife, Rodney P. Carlisle, 2006 Tells the story of the evolution of the Dahlgren Laboratory from a proof and test facility into a modern research and development center crucial to the technological evolution of the United States Navy The sound of freedom: Naval Weapons Technology at Dahlgren, Virginia 1918-2006 James P. Rife, 2006 This book tells the story of the evolution of the Dahlgren Laboratory from a naval proof and test facility into a modern research and development center crucial to the technological evolution of the U S Navy Combining a close analysis of the technical work that led to the improvements in weapons bombsights missiles and the computers that provided their guidance with a close account of changing management styles this work recounts many previously classified stories Makin' Numbers I. Bernard Cohen, Gregory W. Welch, Robert V. D. Campbell, 1999 This collection of technical essays and reminiscences is a companion to I Bernard Cohen's biography *Howard Aiken Portrait of a Computer Pioneer* After an overview by Cohen Part I presents the complete publication of Aiken's 1937 proposal for an automatic calculating machine later realized as the Mark I as well as recollections by the chief engineer in charge of construction of Mark II Robert Campbell and the programmer of Mark I Richard Bloch Henry Tropp describes Aiken's hostility to the exclusive use of binary numbers in computational systems and his alternative approach *The Rhetoric of Numbers in Gibbon's History* F. P. Lock, 2012-09-28 Gibbon aspired to combine the critical analysis of the eighteenth century philosophe with the older traditions of the humanist and scholarly historian His different uses of numbers to inform and to persuade illustrate his remarkable fusion of these approaches This book the first to be devoted to a historian's use of numbers shows how carefully Gibbon interrogated and deployed the numerical evidence in his sources to create a more accurate historical narrative to demonstrate his own reliability and candor as a historian and to convince readers of the

validity of his interpretations of characters and events

**Turing's Revolution** Giovanni Sommaruga, Thomas Strahm, 2016-01-21 This book provides an overview of the confluence of ideas in Turing's era and work and examines the impact of his work on mathematical logic and theoretical computer science. It combines contributions by well-known scientists on the history and philosophy of computability theory as well as on generalised Turing computability. By looking at the roots and at the philosophical and technical influence of Turing's work, it is possible to gather new perspectives and new research topics which might be considered as a continuation of Turing's working ideas well into the 21st century. **The Great American Songbook** Steven Suskin, 2023-04-01 In an age of ubiquitous music and countless new songs releasing every minute, the Great American Songbook endures. After all, the Songbook that sprawling canon of popular songs, standards, and show tunes from roughly the 1920s through the 1950s is a foundational text of American pop music. Rare indeed is the song that doesn't in some way draw on this magnificent corpus, and rare is the person who hasn't heard at least a few of its most enduring melodies. Nonetheless, the Songbook is broader and deeper than most listeners can imagine, and on the margins, the question of whether this or that song should be included is the source of regular arguments among scholars and buffs alike. Attempting to plumb its depths can be a daunting prospect. Enter Steven Suskin, who has been writing about music since the days that Rodgers, Arlen, and Berlin still roamed the streets of Manhattan. In this carefully curated and cheerfully opinionated guidebook, Suskin surveys 201 of the most significant selections from the Songbook, ranging from celebrated masterpieces to forgotten gems. Year by year, he puts songwriters and their contributions in their context and explains what makes each song such a distinctive treat, whether felicitous melody, colorful harmony, compositional originality, or merely the sheer irreducible joy of listening to it. Old and new favorites await all readers of this painstakingly compiled, enthusiastically written catalog.

**The Science of Computing** Matti Tedre, 2014-12-03 The identity of computing has been fiercely debated throughout its short history. Why is it still so hard to define computing as an academic discipline? Is computing a scientific, mathematical, or engineering discipline? By describing the mathematical, engineering, and scientific traditions of computing, *The Science of Computing: Shaping a Discipline* presents a rich picture of computing from the viewpoints of the

field's champions The book helps readers understand the debates about computing as a discipline It explains the context of computing's central debates and portrays a broad perspective of the discipline The book first looks at computing as a formal theoretical discipline that is in many ways similar to mathematics yet different in crucial ways It traces a number of discussions about the theoretical nature of computing from the field's intellectual origins in mathematical logic to modern views of the role of theory in computing The book then explores the debates about computing as an engineering discipline from the central technical innovations to the birth of the modern technical paradigm of computing to computing's arrival as a new technical profession to software engineering gradually becoming an academic discipline It presents arguments for and against the view of computing as engineering within the context of software production and analyzes the clash between the theoretical and practical mindsets The book concludes with the view of computing as a science in its own right not just as a tool for other sciences It covers the early identity debates of computing various views of computing as a science and some famous characterizations of the discipline It also addresses the experimental computer science debate the view of computing as a natural science and the algorithmization of sciences
